First remove `\s__seq` and prepend `\q_no_value`. The first argument of `__seq_get_right_loop:nw` is the last item found, and the second argument is empty until the end of the loop, where it is code that applies `\exp_not:n` to the last item and ends the loop.

```

`\seq_pop_right:NN`
`\seq_pop_right:cN`
`\seq_gpop_right:NN`
`\seq_gpop_right:cN`
`__seq_pop_right:NNN`
`__seq_pop_right_loop:nn`

The approach to popping from the right is a bit more involved, but does use some of the same ideas as getting from the right. What is needed is a “flexible length” way to set a token list variable. This is supplied by the `{\if_false:} \fi: ... \if_false: { \fi: }` construct. Using an x-type expansion and a “non-expanding” definition for `__seq_item:n`, the left-most $n - 1$ entries in a sequence of n items are stored back in the sequence. That needs a loop of unknown length, hence using the

strange `\if_false:` way of including braces. When the last item of the sequence is reached, the closing brace for the assignment is inserted, and `\tl_set:Nn #3` is inserted in front of the final entry. This therefore does the pop assignment. One more iteration is performed, with an empty argument and `\use_none:nn`, which finally stops the loop.

```

17300 }
17301 \cs_generate_variant:Nn \seq_rand_item:N { c }

```

(End of definition for `\seq_rand_item:N`. This function is documented on page 162.)

61.6 Mapping over sequences

`\seq_map_break:` To break a function, the special token `\prg_break_point:Nn` is used to find the end of the code. Any ending code is then inserted before the return value of `\seq_map_break:n` is inserted.

```

17302 \cs_new:Npn \seq_map_break:
17303 { \prg_map_break:Nn \seq_map_break: { } }
17304 \cs_new:Npn \seq_map_break:n
17305 { \prg_map_break:Nn \seq_map_break: }

```

(End of definition for `\seq_map_break:` and `\seq_map_break:n`. These functions are documented on page 166.)

`\seq_map_function:NN` The idea here is to apply the code of #2 to each item in the sequence without altering the definition of `__seq_item:n`. The even-numbered arguments of `__seq_map_function:Nw` delimited by `__seq_item:n` are almost always empty, except at the end of the loop where it is `\prg_break:`. This allows to break the loop without needing to do a (relatively-expensive) quark test.

```

17306 \cs_new:Npn \seq_map_function:NN #1#2
17307 {
17308   \exp_after:wN \use_i_ii:nnn
17309   \exp_after:wN \__seq_map_function:Nw

17324   #4 #1 {#5}
17325   #6 #1 {#7}
17326   #8 #1 {#9}
17327   \__seq_map_function:Nw #1
17328 }
17329 \cs_generate_variant:Nn \seq_map_function:NN { c }

```

(End of definition for `\seq_map_function:NN` and `__seq_map_function:Nw`. This function is documented on page 164.)

`__seq_push_item_def:n` The definition of `__seq_item:n` needs to be saved and restored at various points within the mapping and manipulation code. That is handled here: as always, this approach uses global assignments.
`__seq_push_item_def:e`
`__seq_push_item_def:`
`__seq_pop_item_def:`

```

17330 \cs_new_protected:Npn \__seq_push_item_def:n
17331 {
17332   \__seq_push_item_def:
17333   \cs_gset:Npn \__seq_item:n ##1
17334 }
17335 \cs_new_protected:Npn \__seq_push_item_def:e
17336 {
17337   \__seq_push_item_def:
17338   \cs_gset:Npe \__seq_item:n ##1
17339 }
17340 \cs_new_protected:Npn \__seq_push_item_def:
17341 {
17342   \int_gincr:N \g__kernel_prg_map_int
17343   \cs_gset_eq:cN { \__seq_map_ \int_use:N \g__kernel_prg_map_int :w }
17344   \__seq_item:n
17345 }
17346 \cs_new_protected:Npn \__seq_pop_item_def:
17347 {
17348   \cs_gset_eq:Nc \__seq_item:n
17349   { \__seq_map_ \int_use:N \g__kernel_prg_map_int :w }
17350   \int_gdecr:N \g__kernel_prg_map_int
17351 }

```

(End of definition for __seq_push_item_def:n, __seq_push_item_def:, and __seq_pop_item_def:.)

\seq_map_inline:Nn The idea here is that __seq_item:n is already “applied” to each item in a sequence,
\seq_map_inline:cn and so an in-line mapping is just a case of redefining __seq_item:n.

```

17352 \cs_new_protected:Npn \seq_map_inline:Nn #1#2
17353 {
17354   \__seq_push_item_def:n {#2}
17355   #1
17356   \prg_break_point:Nn \seq_map_break: { \__seq_pop_item_def: }
17357 }
17358 \cs_generate_variant:Nn \seq_map_inline:Nn { c }

```

(End of definition for \seq_map_inline:Nn. This function is documented on page 165.)

\seq_map_tokens:Nn This is based on the function mapping but using the same tricks as described for \prop_
\seq_map_tokens:cn map_tokens:Nn. The idea is to remove the leading \s__seq and apply the tokens such
__seq_map_tokens:nw that they are safe with the break points, hence the \use:n.

```

17359 \cs_new:Npn \seq_map_tokens:Nn #1#2
17360 {
17361   \exp_last_unbraced:Nno
17362   \use_i:nn { \__seq_map_tokens:nw {#2} } #1
17363   \prg_break:
17364   \__seq_item:n { } \__seq_item:n { } \__seq_item:n { } \__seq_item:n { }
17365   \prg_break_point:
17366   \prg_break_point:Nn \seq_map_break: { }
17367 }
17368 \cs_generate_variant:Nn \seq_map_tokens:Nn { c }
17369 \cs_new:Npn \__seq_map_tokens:nw #1
17370   #2 \__seq_item:n #3
17371   #4 \__seq_item:n #5
17372   #6 \__seq_item:n #7

```

```

17373     #8 \__seq_item:n #9
17374     {
17375         #2 \use:n {#1} {#3}
17376         #4 \use:n {#1} {#5}
17377         #6 \use:n {#1} {#7}
17378         #8 \use:n {#1} {#9}
17379         \__seq_map_tokens:nw {#1}
17380     }

```

(End of definition for \seq_map_tokens:Nn and __seq_map_tokens:nw. This function is documented on page 165.)

\seq_map_variable:NNn This is just a specialised version of the in-line mapping function, using an e-type expansion for the code set up so that the number of # tokens required is as expected.

```

\seq_map_variable:Ncn
\seq_map_variable:cNn
\seq_map_variable:ccn

\seq_map_pairwise_function:ccN
\__seq_map_pairwise_function:wNN
\__seq_map_pairwise_function:wNw
\__seq_map_pairwise_function:Nnnwnn

```

The idea is to first expand both sequences, adding the usual `{ ? \prg_break: } { }` to the end of each one. This is most conveniently done in two steps using an auxiliary function. The mapping then throws away the first tokens of #2 and #5, which for items in both sequences are `\s__seq __seq_item:n`. The function to be mapped are then be applied to the two entries. When the code hits the end of one of the sequences, the break material stops the entire loop and tidy up. This avoids needing to find the count of the two sequences, or worrying about which is longer.

```

17452 \cs_new_protected:Npn \seq_gset_map_e:NNn
17453 { \__seq_set_map_e:NNNn \__kernel_tl_gset:Nx }
17454 \cs_new_protected:Npn \__seq_set_map_e:NNNn #1#2#3#4
17455 {
17456   \__seq_push_item_def:n { \exp_not:N \__seq_item:n {#4} }
17457   #1 #2 { #3 }
17458   \__seq_pop_item_def:
17459 }

```

(End of definition for `\seq_set_map_e:NNn`, `\seq_gset_map_e:NNn`, and `__seq_set_map_e:NNNn`. These functions are documented on page 167.)

`\seq_set_map:NNn` Similar to `\seq_set_map_e:NNn`, but prevents expansion of the `<inline function>`.
`\seq_gset_map:NNn`
`__seq_set_map:NNNn`

```

17460 \cs_new_protected:Npn \seq_set_map:NNn
17461 { \__seq_set_map:NNNn \__kernel_tl_set:Nx }
17462 \cs_new_protected:Npn \seq_gset_map:NNn
17463 { \__seq_set_map:NNNn \__kernel_tl_gset:Nx }
17464 \cs_new_protected:Npn \__seq_set_map:NNNn #1#2#3#4
17465 {
17466   \__seq_push_item_def:n { \exp_not:n { \__seq_item:n {#4} } }
17467   #1 #2 { #3 }
17468   \__seq_pop_item_def:
17469 }

```

(End of definition for `\seq_set_map:NNn`, `\seq_gset_map:NNn`, and `__seq_set_map:NNNn`. These functions are documented on page 166.)

`\seq_count:N` Since counting the items in a sequence is quite common, we optimize it by grabbing
`\seq_count:c` 8 items at a time and correspondingly adding 8 to an integer expression. At the end of
`__seq_count:w` the loop, #9 is `__seq_count_end:w` instead of being empty. It removes 8+ and instead
`__seq_count_end:w` places the number of `__seq_item:n` that `__seq_count:w` grabbed before reaching the
end of the sequence.

```

17470 \cs_new:Npn \seq_count:N #1
17471 {
17472   \int_eval:n
17473   {
17474     \exp_after:wN \use_i:nn
17475     \exp_after:wN \__seq_count:w
17476     #1
17477     \__seq_count_end:w \__seq_item:n 7
17478     \__seq_count_end:w \__seq_item:n 6
17479     \__seq_count_end:w \__seq_item:n 5
17480     \__seq_count_end:w \__seq_item:n 4
17481     \__seq_count_end:w \__seq_item:n 3
17482     \__seq_count_end:w \__seq_item:n 2
17483     \__seq_count_end:w \__seq_item:n 1
17484     \__seq_count_end:w \__seq_item:n 0
17485     \prg_break_point:
17486   }
17487 }
17488 \cs_new:Npn \__seq_count:w
17489 #1 \__seq_item:n #2 \__seq_item:n #3 \__seq_item:n #4 \__seq_item:n

```

```

17490     #5 \__seq_item:n #6 \__seq_item:n #7 \__seq_item:n #8 #9 \__seq_item:n
17491     { #9 8 + \__seq_count:w }
17492 \cs_new:Npn \__seq_count_end:w 8 + \__seq_count:w #1#2 \prg_break_point: {#1}
17493 \cs_generate_variant:Nn \seq_count:N { c }

```

(End of definition for `\seq_count:N`, `__seq_count:w`, and `__seq_count_end:w`. This function is documented on page 167.)

61.7 Using sequences

```

\seq_use:Nnnn See \clist_use:Nnnn for a general explanation. The main difference is that we use
\seq_use:cnnn \__seq_item:n as a delimiter rather than commas. We also need to add \__seq_item:n
\__seq_use:NNnNnn at various places, and \s__seq.
\__seq_use_setup:w 17494 \cs_new:Npn \seq_use:Nnnn #1#2#3#4
\__seq_use:nwwwnwn 17495 {
\__seq_use:nwwn 17496   \seq_if_exist:NTF #1
\seq_use:Nn 17497   {
\seq_use:cn 17498     \int_case:nnF { \seq_count:N #1 }
17499     {
17500       { 0 } { }
17501       { 1 } { \exp_after:wN \__seq_use:NNnNnn #1 ? { } { } }
17502       { 2 } { \exp_after:wN \__seq_use:NNnNnn #1 {#2} }
17503     }
17504     {
17505       \exp_after:wN \__seq_use_setup:w #1 \__seq_item:n
17506       \s__seq_mark { \__seq_use:nwwwnwn {#3} }
17507       \s__seq_mark { \__seq_use:nwwn {#4} }
17508       \s__seq_stop { }
17509     }
17510   }
17511   {
17512     \msg_expandable_error:nnn
17513     { kernel } { bad-variable } {#1}
17514   }
17515 }
17516 \cs_generate_variant:Nn \seq_use:Nnnn { c }
17517 \cs_new:Npn \__seq_use:NNnNnn #1#2#3#4#5#6 { \exp_not:n { #3 #6 #5 } }
17518 \cs_new:Npn \__seq_use_setup:w \s__seq { \__seq_use:nwwwnwn { } }
17519 \cs_new:Npn \__seq_use:nwwwnwn
17520   #1 \__seq_item:n #2 \__seq_item:n #3 \__seq_item:n #4#5
17521   \s__seq_mark #6#7 \s__seq_stop #8
17522   {
17523     #6 \__seq_item:n {#3} \__seq_item:n {#4} #5
17524     \s__seq_mark {#6} #7 \s__seq_stop { #8 #1 #2 }
17525   }
17526 \cs_new:Npn \__seq_use:nwwn #1 \__seq_item:n #2 #3 \s__seq_stop #4
17527   { \exp_not:n { #4 #1 #2 } }
17528 \cs_new:Npn \seq_use:Nn #1#2
17529   { \seq_use:Nnnn #1 {#2} {#2} {#2} }
17530 \cs_generate_variant:Nn \seq_use:Nn { c }

```

(End of definition for `\seq_use:Nnnn` and others. These functions are documented on page 167.)

61.8 Sequence stacks

The same functions as for sequences, but with the correct naming.

```

\seq_push:Nn      Pushing to a sequence is the same as adding on the left.
\seq_push:NV      17531 \cs_new_eq:NN \seq_push:Nn \seq_put_left:Nn
\seq_push:Nv      17532 \cs_generate_variant:Nn \seq_push:Nn { NV , Nv , Ne , c , cV , cv , ce }
\seq_push:Ne      17533 \cs_generate_variant:Nn \seq_push:Nn { No , Nx , co , cx }
\seq_push:No      17534 \cs_new_eq:NN \seq_gpush:Nn \seq_gput_left:Nn
\seq_push:Nx      17535 \cs_generate_variant:Nn \seq_gpush:Nn { NV , Nv , Ne , c , cV , cv , ce }
\seq_push:cn      17536 \cs_generate_variant:Nn \seq_gpush:Nn { No , Nx , co , cx }
\seq_push:cV      (End of definition for \seq_push:Nn and \seq_gpush:Nn. These functions are documented on page 169.)
\seq_push:cv
\seqppush:Nn      In most cases, getting items from the stack does not need to specify that this is from the
\seqppush:cn      left. So alias are provided.
\seqppush:Nn      17537 \cs_new_eq:NN \seq_get:NN \seq_get_left:NN
\seqpop:Nn        17538 \cs_new_eq:NN \seq_get:cN \seq_get_left:cN
\seqpop:Nv        17539 \cs_new_eq:NN \seq_pop:NN \seq_pop_left:NN
\seqpop:Nx        17540 \cs_new_eq:NN \seq_pop:cN \seq_pop_left:cN
\seqpop:Ne        17541 \cs_new_eq:NN \seq_gpop:NN \seq_gpop_left:NN
\seqpop:No        17542 \cs_new_eq:NN \seq_gpop:cN \seq_gpop_left:cN
\seqpop:Nx        (End of definition for \seq_get:NN, \seq_pop:NN, and \seq_gpop:NN. These functions are documented
\seqpop:cn        on page 168.)
\seqpop:cV
\seq_get:NNTF      More copies.
\seq_get:NNTF      17543 \prg_new_eq_conditional:NNn \seq_get:NN \seq_get_left:NN { T , F , TF }
\seq_get:NNTF      17544 \prg_new_eq_conditional:NNn \seq_get:cN \seq_get_left:cN { T , F , TF }
\seq_pop:NNTF      17545 \prg_new_eq_conditional:NNn \seq_pop:NN \seq_pop_left:NN { T , F , TF }
\seq_pop:NNTF      17546 \prg_new_eq_conditional:NNn \seq_pop:cN \seq_pop_left:cN { T , F , TF }
\seq_gpop:NNTF     17547 \prg_new_eq_conditional:NNn \seq_gpop:NN \seq_gpop_left:NN { T , F , TF }
\seq_gpop:NNTF     17548 \prg_new_eq_conditional:NNn \seq_gpop:cN \seq_gpop_left:cN { T , F , TF }
\seq_gpop:cNNTF

```

(End of definition for \seq_get:NNTF, \seq_pop:NNTF, and \seq_gpop:NNTF. These functions are documented on page 168.)

61.9 Viewing sequences

```

\seq_show:N      Apply the general \__kernel_chk_tl_type:NnnT.
\seq_show:c      17549 \cs_new_protected:Npn \seq_show:N { \__seq_show:NN \msg_show:nneeee }
\seq_log:N       17550 \cs_generate_variant:Nn \seq_show:N { c }
\seq_log:c       17551 \cs_new_protected:Npn \seq_log:N { \__seq_show:NN \msg_log:nneeee }
\__seq_show:NN   17552 \cs_generate_variant:Nn \seq_log:N { c }
\__seq_show_validate:nn 17553 \cs_new_protected:Npn \__seq_show:NN #1#2
                  17554 {
                  17555   \__kernel_chk_tl_type:NnnT #2 { seq }
                  17556   {
                  17557     \s__seq
                  17558     \exp_after:wN \use_i:nn \exp_after:wN \__seq_show_validate:nn #2
                  17559     \q_recursion_tail \q_recursion_tail \q_recursion_stop
                  17560   }
                  17561   {
                  17562     #1 { seq } { show }

```

```

17563         { \token_to_str:N #2 }
17564         { \seq_map_function:NN #2 \msg_show_item:n }
17565         { } { }
17566     }
17567 }
17568 \cs_new:Npn \__seq_show_validate:nn #1#2
17569 {
17570     \quark_if_recursion_tail_stop:n {#2}
17571     \__seq_wrap_item:n {#2}
17572     \__seq_show_validate:nn
17573 }

```

(End of definition for `\seq_show:N` and others. These functions are documented on page [171](#).)

61.10 Scratch sequences

`\l_tmpa_seq` Temporary comma list variables.

```

\l_tmpb_seq 17574 \seq_new:N \l_tmpa_seq
\g_tmpa_seq 17575 \seq_new:N \l_tmpb_seq
\g_tmpb_seq 17576 \seq_new:N \g_tmpa_seq
17577 \seq_new:N \g_tmpb_seq

```

(End of definition for `\l_tmpa_seq` and others. These variables are documented on page [171](#).)

```

17578 </code>

```

Chapter 62

l3int implementation

17579 `*code`

17580 `\@@=int`

The following test files are used for this code: m3int001,m3int002,m3int03.

`\c_max_register_int` Done in l3basics.

(End of definition for \c_max_register_int. This variable is documented on page 185.)

`__int_to_roman:w` Done in l3basics.

`\if_int_compare:w` *(End of definition for __int_to_roman:w and \if_int_compare:w. This function is documented on page 186.)*

`\or:` Done in l3basics.

(End of definition for \or:. This function is documented on page 186.)

`\int_value:w` Here are the remaining primitives for number comparisons and expressions.

<code>__int_eval:w</code>	17581	<code>\cs_new_eq:NN \int_value:w</code>	<code>\tex_number:D</code>
<code>__int_eval_end:</code>	17582	<code>\cs_new_eq:NN __int_eval:w</code>	<code>\tex_numexpr:D</code>
<code>\if_int_odd:w</code>	17583	<code>\cs_new_eq:NN __int_eval_end:</code>	<code>\tex_relax:D</code>
<code>\if_case:w</code>	17584	<code>\cs_new_eq:NN \if_int_odd:w</code>	<code>\tex_ifodd:D</code>
	17585	<code>\cs_new_eq:NN \if_case:w</code>	<code>\tex_ifcase:D</code>

(End of definition for \int_value:w and others. These functions are documented on page 185.)

`\s__int_mark` Scan marks used throughout the module.

<code>\s__int_stop</code>	17586	<code>\scan_new:N \s__int_mark</code>
	17587	<code>\scan_new:N \s__int_stop</code>

(End of definition for \s__int_mark and \s__int_stop.)

`__int_use_none_delimit_by_s_stop:w` Function to gobble until a scan mark.

17588 `\cs_new:Npn __int_use_none_delimit_by_s_stop:w #1 \s__int_stop { }`

(End of definition for __int_use_none_delimit_by_s_stop:w.)

`\q__int_recursion_tail` Quarks for recursion.

<code>\q__int_recursion_stop</code>	17589	<code>\quark_new:N \q__int_recursion_tail</code>
	17590	<code>\quark_new:N \q__int_recursion_stop</code>

(End of definition for `\q__int_recursion_tail` and `\q__int_recursion_stop`.)

`__int_if_recursion_tail_stop_do:Nn`
`__int_if_recursion_tail_stop:N`

Functions to query quarks.

```
17591 \__kernel_quark_new_test:N \__int_if_recursion_tail_stop_do:Nn
17592 \__kernel_quark_new_test:N \__int_if_recursion_tail_stop:N
```

(End of definition for `__int_if_recursion_tail_stop_do:Nn` and `__int_if_recursion_tail_stop:N`.)

62.1 Integer expressions

`\int_eval:n` Wrapper for `__int_eval:w`: can be used in an integer expression or directly in the input stream. It is very slightly faster to use `\the` rather than `\number` to turn the expression to a number. When debugging, we introduce parentheses to catch early termination (see `!3debug`).

`\int_eval:w`

```
17593 \cs_new:Npn \int_eval:n #1
17594 { \tex_the:D \__int_eval:w #1 \__int_eval_end: }
17595 \cs_new:Npn \int_eval:w { \tex_the:D \__int_eval:w }
```

(End of definition for `\int_eval:n` and `\int_eval:w`. These functions are documented on page [173](#).)

`__int_sep:`

```
17596 \cs_new_eq:NN \__int_sep: \__kernel_int_sep:
```

(End of definition for `__int_sep:.`)

`\int_sign:n` See `\int_abs:n`. Evaluate the expression once (and when debugging is enabled, check that the expression is well-formed), then test the first character to determine the sign. This is wrapped in `\int_value:w ... \exp_stop_f:` to ensure a fixed number of expansions and to avoid dealing with closing the conditionals.

`__int_sign:Nw`

```
17597 \cs_new:Npn \int_sign:n #1
17598 {
17599   \int_value:w \exp_after:wN \__int_sign:Nw
17600   \int_value:w \__int_eval:w #1 \__int_eval_end: \__int_sep:
17601   \exp_stop_f:
17602 }
17603 \cs_new:Npn \__int_sign:Nw #1#2 \__int_sep:
17604 {
17605   \if_meaning:w 0 #1
17606   0
17607   \else:
17608     \if_meaning:w - #1 - \fi: 1
17609   \fi:
17610 }
```

(End of definition for `\int_sign:n` and `__int_sign:Nw`. This function is documented on page [173](#).)

`\int_abs:n` Functions for min, max, and absolute value with only one evaluation. The absolute value is obtained by removing a leading sign if any. All three functions expand in two steps.

`__int_abs:N`

`\int_max:nn`

`\int_min:nn`

`__int_maxmin:wwN`

```
17611 \cs_new:Npn \int_abs:n #1
17612 {
17613   \int_value:w \exp_after:wN \__int_abs:N
17614   \int_value:w \__int_eval:w #1 \__int_eval_end:
17615   \exp_stop_f:
```

```

17616 }
17617 \cs_new:Npn \__int_abs:N #1
17618 { \if_meaning:w - #1 \else: \exp_after:wN #1 \fi: }
17619 \cs_new:Npn \int_max:nn #1#2
17620 {
17621   \int_value:w \exp_after:wN \__int_maxmin:wwN
17622   \int_value:w \__int_eval:w #1 \exp_after:wN \__int_sep:
17623   \int_value:w \__int_eval:w #2 \__int_sep:
17624   >
17625   \exp_stop_f:
17626 }
17627 \cs_new:Npn \int_min:nn #1#2
17628 {
17629   \int_value:w \exp_after:wN \__int_maxmin:wwN
17630   \int_value:w \__int_eval:w #1 \exp_after:wN \__int_sep:
17631   \int_value:w \__int_eval:w #2 \__int_sep:
17632   <
17633   \exp_stop_f:
17634 }
17635 \cs_new:Npn \__int_maxmin:wwN #1 \__int_sep: #2 \__int_sep: #3
17636 {
17637   \if_int_compare:w #1 #3 #2 ~
17638   #1
17639   \else:
17640   #2
17641   \fi:
17642 }

```

(End of definition for `\int_abs:n` and others. These functions are documented on page 173.)

`\int_div_truncate:nn` As `__int_eval:w` rounds the result of a division we also provide a version that truncates the result. We use an auxiliary to make sure numerator and denominator are only evaluated once: this comes in handy when those are more expressions are expensive to evaluate (e.g., `\tl_count:n`). If the numerator `#1#2` is 0, then we divide 0 by the denominator (this ensures that 0/0 is correctly reported as an error). Otherwise, shift the numerator `#1#2` towards 0 by $(| \#3\#4 | - 1)/2$, which we round away from zero. It turns out that this quantity exactly compensates the difference between ε -TeX's rounding and the truncating behaviour that we want. The details are thanks to Heiko Oberdiek: getting things right in all cases is not so easy.

```

17643 \cs_new:Npn \int_div_truncate:nn #1#2
17644 {
17645   \int_value:w \__int_eval:w
17646   \exp_after:wN \__int_div_truncate:NwNw
17647   \int_value:w \__int_eval:w #1 \exp_after:wN \__int_sep:
17648   \int_value:w \__int_eval:w #2 \__int_sep:
17649   \__int_eval_end:
17650 }
17651 \cs_new:Npn \__int_div_truncate:NwNw #1#2 \__int_sep: #3#4 \__int_sep:
17652 {
17653   \if_meaning:w 0 #1
17654   0
17655   \else:
17656   (
17657     #1#2

```

```

17658     \if_meaning:w - #1 + \else: - \fi:
17659     ( \if_meaning:w - #3 - \fi: #3#4 - 1 ) / 2
17660   )
17661   \fi:
17662   / #3#4
17663 }

```

For the sake of completeness:

```

17664 \cs_new:Npn \int_div_round:nn #1#2
17665 { \int_value:w \__int_eval:w ( #1 ) / ( #2 ) \__int_eval_end: }

```

Finally there's the modulus operation.

```

17666 \cs_new:Npn \int_mod:nn #1#2
17667 {
17668   \int_value:w \__int_eval:w \exp_after:wN \__int_mod:ww
17669   \int_value:w \__int_eval:w #1 \exp_after:wN \__int_sep:
17670   \int_value:w \__int_eval:w #2 \__int_sep:
17671   \__int_eval_end:
17672 }
17673 \cs_new:Npn \__int_mod:ww #1 \__int_sep: #2 \__int_sep:
17674 { #1 - ( \__int_div_truncate:NwNw #1 \__int_sep: #2 \__int_sep: ) * #2 }

```

(End of definition for `\int_div_truncate:nn` and others. These functions are documented on page 173.)

`__kernel_int_add:nnn` Equivalent to `\int_eval:n {#1+#2+#3}` except that overflow only occurs if the final result overflows $[-2^{31} + 1, 2^{31} - 1]$. The idea is to choose the order in which the three numbers are added together. If #1 and #2 have opposite signs (one is in $[-2^{31} + 1, -1]$ and the other in $[0, 2^{31} - 1]$) then #1+#2 cannot overflow so we compute the result as #1+#2+#3. If they have the same sign, then either #3 has the same sign and the order does not matter, or #3 has the opposite sign and any order in which #3 is not last will work. We use #1+#3+#2.

```

17675 \cs_new:Npn \__kernel_int_add:nnn #1#2#3
17676 {
17677   \int_value:w \__int_eval:w #1
17678   \if_int_compare:w #2 < \c_zero_int \exp_after:wN \reverse_if:N \fi:
17679   \if_int_compare:w #1 < \c_zero_int + #2 + #3 \else: + #3 + #2 \fi:
17680   \__int_eval_end:
17681 }

```

(End of definition for `__kernel_int_add:nnn`.)

62.2 Creating and initialising integers

`\int_new:N` Two ways to do this: one for the format and one for the L^AT_EX 2_ε package. In plain T_EX, `\int_new:c` `\newcount` (and other allocators) are `\outer:` to allow the code here to work in “generic” mode this is therefore accessed by name. (The same applies to `\newbox`, `\newdimen` and so on.)

```

17682 \cs_new_protected:Npn \int_new:N #1
17683 {
17684   \__kernel_chk_if_free_cs:N #1
17685   \cs:w newcount \cs_end: #1
17686 }
17687 \cs_generate_variant:Nn \int_new:N { c }

```

(End of definition for `\int_new:N`. This function is documented on page 174.)

`\int_const:Nn` As stated, most constants can be defined as `\chardef` or `\mathchardef` but that's engine dependent. As a result, there is some set up code to determine what can be done. No full engine testing just yet so everything is a little awkward. We cannot use `\int_gset:Nn` because (when `check-declarations` is enabled) this runs some checks that constants would fail.

`\int_const:cn`

`__int_const:nN`

`__int_const:eN`

`__int_constdef:Nw`

`\c_int_max_constdef_int`

```

17688 \cs_new_protected:Npn \int_const:Nn #1#2
17689   { \__int_const:eN { \int_eval:n {#2} } #1 }
17690 \cs_generate_variant:Nn \int_const:Nn { c }
17691 \cs_new_protected:Npn \__int_const:nN #1#2
17692   {

17741 { TF , T , F , p }

(End of definition for \int_if_exist:NTF. This function is documented on page 174.)

62.3 Setting and incrementing integers

\int_add:Nn Adding and subtracting to and from a counter. Including here the optional by would
\int_add:cn slow down these operations by a few percent.
\int_gadd:Nn 17742 \cs_new_protected:Npn \int_add:Nn #1#2
\int_gadd:cn 17743 { \tex_advance:D #1 __int_eval:w #2 __int_eval_end: }
\int_sub:Nn 17744 \cs_new_protected:Npn \int_sub:Nn #1#2
\int_sub:cn 17745 { \tex_advance:D #1 - __int_eval:w #2 __int_eval_end: }
\int_gsub:Nn 17746 \cs_new_protected:Npn \int_gadd:Nn #1#2
\int_gsub:cn 17747 { \tex_global:D \tex_advance:D #1 __int_eval:w #2 __int_eval_end: }
17748 \cs_new_protected:Npn \int_gsub:Nn #1#2
17749 { \tex_global:D \tex_advance:D #1 - __int_eval:w #2 __int_eval_end: }
17750 \cs_generate_variant:Nn \int_add:Nn { c }
17751 \cs_generate_variant:Nn \int_gadd:Nn { c }
17752 \cs_generate_variant:Nn \int_sub:Nn { c }
17753 \cs_generate_variant:Nn \int_gsub:Nn { c }

(End of definition for \int_add:Nn and others. These functions are documented on page 175.)

\int_incr:N Incrementing and decrementing of integer registers is done with the following functions.
\int_incr:c 17754 \cs_new_protected:Npn \int_incr:N #1
\int_gincr:N 17755 { \tex_advance:D #1 \c_one_int }
\int_gincr:c 17756 \cs_new_protected:Npn \int_decr:N #1
\int_decr:N 17757 { \tex_advance:D #1 - \c_one_int }
\int_decr:c
\int_gdecr:N
\int_gdecr:c

```

17758 \cs_new_protected:Npn \int_gincr:N #1
17759 { \tex_global:D \tex_advance:D #1 \c_one_int }
17760 \cs_new_protected:Npn \int_gdecr:N #1
17761 { \tex_global:D \tex_advance:D #1 - \c_one_int }
17762 \cs_generate_variant:Nn \int_incr:N { c }
17763 \cs_generate_variant:Nn \int_decr:N { c }
17764 \cs_generate_variant:Nn \int_gincr:N { c }
17765 \cs_generate_variant:Nn \int_gdecr:N { c }

```

(End of definition for `\int_incr:N` and others. These functions are documented on page 175.)

```

\int_set:Nn As integers are register-based TEX issues an error if they are not defined. While the =
\int_set:cn sign is optional, this version with = is slightly quicker than without, while adding the
\int_set:NV optional space after = slows things down minutely.
\int_set:cV
\int_gset:Nn 17766 \cs_new_protected:Npn \int_set:Nn #1#2
\int_gset:cn 17767 { #1 = \__int_eval:w #2 \__int_eval_end: }
\int_gset:NV 17768 \cs_new_protected:Npn \int_gset:Nn #1#2
\int_gset:cV 17769 { \tex_global:D #1 = \__int_eval:w #2 \__int_eval_end: }
17770 \cs_generate_variant:Nn \int_set:Nn { NV , c , cV }
17771 \cs_generate_variant:Nn \int_gset:Nn { NV , c , cV }

```

(End of definition for `\int_set:Nn` and `\int_gset:Nn`. These functions are documented on page 175.)

```

\int_set_regex_count:Nnn
\int_set_regex_count:cn 17772 \cs_new_protected:Npn \int_set_regex_count:Nnn #1#2#3
\int_gset_regex_count:Nnn 17773 { \regex_count:nnN {#2} {#3} #1 }

17789 \group_begin:
17790 \int_set_eq:NN \l__int_internal_a_int #1
17791 \regex_count:NnN #2 {#3} \l__int_internal_a_int
17792 \int_gset_eq:NN #1 \l__int_internal_a_int
17793 \group_end:
17794 }
17795 \cs_generate_variant:Nn \int_gset_regex_count:NNn { c }

```

(End of definition for `\int_set_regex_count:Nnn` and others. These functions are documented on page 175.)

62.4 Using integers

`\int_use:N` Here is how counters are accessed. We hand-code the `c` variant for some speed gain.

```
\int_use:c
17796 \cs_new_eq:NN \int_use:N \tex_the:D
17797 \cs_new:Npn \int_use:c #1 { \tex_the:D \cs:w #1 \cs_end: }
```

(End of definition for `\int_use:N`. This function is documented on page 176.)

62.5 Integer expression conditionals

`__int_compare_error:` Those functions are used for comparison tests which use a simple syntax where only one set of braces is required and additional operators such as `!=` and `>=` are supported. The tests first evaluate their left-hand side, with a trailing `__int_compare_error:`. This marker is normally not expanded, but if the relation symbol is missing from the test's argument, then the marker inserts `=` (and itself) after triggering the relevant TeX error. If the first token which appears after evaluating and removing the left-hand side is not a known relation symbol, then a judiciously placed `__int_compare_error:Nw` gets expanded, cleaning up the end of the test and telling the user what the problem was.

```
17798 \cs_new_protected:Npn \__int_compare_error:
17799 {
17800   \if_int_compare:w \c_zero_int \c_zero_int \fi:
17801   =
17802   \__int_compare_error:
17803 }
17804 \cs_new:Npn \__int_compare_error:Nw
17805   #1#2 \s__int_stop
17806 {
17807   { }
17808   \c_zero_int \fi:
17809   \msg_expandable_error:nnn
17810     { kernel } { unknown-comparison } {#1}
17811   \prg_return_false:
17812 }
```

(End of definition for `__int_compare_error:` and `__int_compare_error:Nw`.)

```
\int_compare_p:n
\int_compare:nTF
\__int_compare:w
\__int_compare:Nw
\__int_compare:NNw
\__int_compare:nnN
\__int_compare_end:=:NNw
\__int_compare_=:NNw
\__int_compare_<:NNw
\__int_compare_>:NNw
\__int_compare_==:NNw
\__int_compare_!=:NNw
\__int_compare_<=:NNw
\__int_compare_>=:NNw
```

Comparison tests using a simple syntax where only one set of braces is required, additional operators such as `!=` and `>=` are supported, and multiple comparisons can be performed at once, for instance `0 < 5 <= 1`. The idea is to loop through the argument, finding one operand at a time, and comparing it to the previous one. The looping auxiliary `__int_compare:Nw` reads one *operand* and one *comparison* symbol, and leaves roughly

```

  <operand> \prg_return_false: \fi:
  \reverse_if:N \if_int_compare:w <operand> <comparison>
  \__int_compare:Nw
```

in the input stream. Each call to this auxiliary provides the second operand of the last call's `\if_int_compare:w`. If one of the *comparisons* is `false`, the `true` branch of the TeX conditional is taken (because of `\reverse_if:N`), immediately returning `false` as the result of the test. There is no TeX conditional waiting the first operand, so we add an `\if_false:` and expand by hand with `\int_value:w`, thus skipping `\prg_return_false:` on the first iteration.

Before starting the loop, the first step is to make sure that there is at least one relation symbol. We first let \TeX evaluate this left hand side of the (in)equality using _int_eval:w . Since the relation symbols $<$, $>$, $=$ and $!$ are not allowed in integer expressions, they would terminate the expression. If the argument contains no relation symbol, $\text{_int_compare_error:}$ is expanded, inserting $=$ and itself after an error. In all cases, _int_compare:w receives as its argument an integer, a relation symbol, and some more tokens. We then setup the loop, which is ended by the two odd-looking items e and _nd_ , with a trailing _int_stop used to grab the entire argument when necessary.

```

17813 \prg_new_conditional:Npnn \int_compare:n #1 { p , T , F , TF }
17814 {
17815     \exp_after:wN \_int_compare:w
17816     \int_value:w \_int_eval:w #1 \_int_compare_error:
17817 }
17818 \cs_new:Npn \_int_compare:w #1 \_int_compare_error:
17819 {
17820     \exp_after:wN \if_false: \int_value:w
17821     \_int_compare:Nw #1 e { = nd_ } \_int_stop
17822 }

```

The goal here is to find an $\langle operand \rangle$ and a $\langle comparison \rangle$. The $\langle operand \rangle$ is already evaluated, but we cannot yet grab it as an argument. To access the following relation symbol, we remove the number by applying _int_to_roman:w , after making sure that the argument becomes non-positive: its roman numeral representation is then empty. Then probe the first two tokens with _int_compare:NNw to determine the relation symbol, building a control sequence from it (\token_to_str:N gives better errors if $\#1$ is not a character). All the extended forms have an extra $=$ hence the test for that as a second token. If the relation symbol is unknown, then the control sequence is turned by \TeX into \scan_stop: , ignored thanks to \unexpanded , and $\text{_int_compare_error:Nw}$ raises an error.

```

17823 \cs_new:Npn \_int_compare:Nw #1#2 \_int_stop
17824 {
17825     \exp_after:wN \_int_compare:NNw
17826     \_int_to_roman:w - 0 #2 \_int_mark
17827     #1#2 \_int_stop
17828 }
17829 \cs_new:Npn \_int_compare:NNw #1#2#3 \_int_mark
17830 {
17831     \_kernel_exp_not:w
17832     \use:c
17833     {
17834         \_int_compare_ \token_to_str:N #1
17835         \if_meaning:w = #2 = \fi:
17836         :NNw
17837     }
17838     \_int_compare_error:Nw #1
17839 }

```

When the last $\langle operand \rangle$ is seen, _int_compare:NNw receives e and _nd_ as arguments, hence calling $\text{_int_compare_end_=:NNw}$ to end the loop: return the result of the last comparison (involving the operand that we just found). When a normal relation is found, the appropriate auxiliary calls _int_compare:nnN where $\#1$ is \if_int_compare:w or $\text{\reverse_if:N \if_int_compare:w}$, $\#2$ is the $\langle operand \rangle$, and $\#3$ is one of $<$, $=$,

or >. As announced earlier, we leave the *<operand>* for the previous conditional. If this conditional is true the result of the test is known, so we remove all tokens and return false. Otherwise, we apply the conditional #1 to the *<operand>* #2 and the comparison #3, and call `__int_compare:Nw` to look for additional operands, after evaluating the following expression.

```

17840 \cs_new:cpn { __int_compare_end=:NNw } #1#2#3 e #4 \s__int_stop
17841 {
17842   {#3} \exp_stop_f:
17843   \prg_return_false: \else: \prg_return_true: \fi:
17844 }
17845 \cs_new:Npn \__int_compare:nnN #1#2#3
17846 {
17847   {#2} \exp_stop_f:
17848   \prg_return_false: \exp_after:wN \__int_use_none_delimit_by_s_stop:w
17849   \fi:
17850   #1 #2 #3 \exp_after:wN \__int_compare:Nw \int_value:w \__int_eval:w
17851 }
```

The actual comparisons are then simple function calls, using the relation as delimiter for a delimited argument and discarding `__int_compare_error:Nw` (*token*) responsible for error detection.

```

17852 \cs_new:cpn { __int_compare=:NNw } #1#2#3 =
17853 { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} = }
17854 \cs_new:cpn { __int_compare:<:NNw } #1#2#3 <
17855 { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} < }
17856 \cs_new:cpn { __int_compare:>:NNw } #1#2#3 >
17857 { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} > }
17858 \cs_new:cpn { __int_compare:=:NNw } #1#2#3 ==
17859 { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} = }
17860 \cs_new:cpn { __int_compare!=:NNw } #1#2#3 !=
17861 { \__int_compare:nnN { \if_int_compare:w } {#3} = }
17862 \cs_new:cpn { __int_compare<=:NNw } #1#2#3 <=
17863 { \__int_compare:nnN { \if_int_compare:w } {#3} > }
17864 \cs_new:cpn { __int_compare>=:NNw } #1#2#3 >=
17865 { \__int_compare:nnN { \if_int_compare:w } {#3} < }
```

(End of definition for `\int_compare:nTF` and others. This function is documented on page 177.)

`\int_compare_p:nNn` More efficient but less natural in typing.

```

\int_compare:nNnTF
17866 \prg_new_conditional:Npnn \int_compare:nNn #1#2#3 { p , T , F , TF }
17867 {

(End of definition for `\int_if_odd:nTF` and `\int_if_even:nTF`. These functions are documented on page 178.)

62.6 Integer expression loops

`\int_while_do:nn` These are quite easy given the above functions. The `while` versions test first and then execute the body. The `do_while` does it the other way round.

```

\int_until_do:nn
\int_do_while:nn
\int_do_until:nn
17928 \cs_new:Npn \int_while_do:nn #1#2
17929 {
17930     \int_compare:nT {#1}
17931     {
17932         #2
17933         \int_while_do:nn {#1} {#2}
17934     }
17935 }
17936 \cs_new:Npn \int_until_do:nn #1#2
17937 {
17938     \int_compare:nF {#1}
17939     {
17940         #2
17941         \int_until_do:nn {#1} {#2}
17942     }
17943 }
17944 \cs_new:Npn \int_do_while:nn #1#2
17945 {
17946     #2
17947     \int_compare:nT {#1}
17948     { \int_do_while:nn {#1} {#2} }
17949 }
17950 \cs_new:Npn \int_do_until:nn #1#2
17951 {
17952     #2
17953     \int_compare:nF {#1}
17954     { \int_do_until:nn {#1} {#2} }
17955 }

```

(End of definition for `\int_while_do:nn` and others. These functions are documented on page 179.)

`\int_while_do:nNnn` As above but not using the more natural syntax.

```

\int_until_do:nNnn
\int_do_while:nNnn
\int_do_until:nNnn
17956 \cs_new:Npn \int_while_do:nNnn #1#2#3#4
17957 {
17958     \int_compare:nNnT {#1} #2 {#3}
17959     {
17960         #4
17961         \int_while_do:nNnn {#1} #2 {#3} {#4}
17962     }

```

```

17963     }
17964 \cs_new:Npn \int_until_do:nNnn #1#2#3#4
17965 {
17966     \int_compare:nNnF {#1} #2 {#3}
17967     {
17968         #4

17982     { \int_do_until:nNnn {#1} #2 {#3} {#4} }
17983 }

```

(End of definition for `\int_while_do:nNnn` and others. These functions are documented on page 179.)

62.7 Integer step functions

`\int_step_function:nnnN` Before all else, evaluate the initial value, step, and final value. Repeating a function by steps first needs a check on the direction of the steps. After that, do the function for the start value then step and loop around. It would be more symmetrical to test for a step size of zero before checking the sign, but we optimize for the most frequent case (positive step). And since when we're doing the test the step size is the result of `__int_eval:w` we know that only the value 0 has a leading token 0 which we can use for a faster test than `\int_compare:nNnTF`.

```

17984 \cs_new:Npn \int_step_function:nnnN #1#2#3
17985 {
17986     \exp_after:wN \__int_step:w
17987     \int_value:w \__int_eval:w #1 \exp_after:wN \__int_sep:
17988     \int_value:w \__int_eval:w #2 \exp_after:wN \__int_sep:
17989     \int_value:w \__int_eval:w #3 \__int_sep:
17990 }
17991 \cs_new:Npn \__int_step:w #1 \__int_sep: #2 \__int_sep: #3 \__int_sep: #4

18019 }
18020 \cs_new:Npn \int_step_function:nN
18021 { \int_step_function:nnnN \c_one_int \c_one_int }
18022 \cs_new:Npn \int_step_function:nnN #1
18023 { \int_step_function:nnnN {#1} \c_one_int }

```

(End of definition for `\int_step_function:nnnN` and others. These functions are documented on page 180.)

`\int_step_tokens:nn`
`\int_step_tokens:nnn`
`\int_step_tokens:nnnn`

Because the internals `__int_step:wwwN` and `__int_step:Nwnnn` are defined in such a way that they work with both a single token or a braced group of tokens these are really the same as the function variants.

```

18024 \cs_new_eq:NN \int_step_tokens:nn \int_step_function:nN
18025 \cs_new_eq:NN \int_step_tokens:nnn \int_step_function:nnN
18026 \cs_new_eq:NN \int_step_tokens:nnnn \int_step_function:nnnN

```

(End of definition for `\int_step_tokens:nn`, `\int_step_tokens:nnn`, and `\int_step_tokens:nnnn`. These functions are documented on page 180.)

`\int_step_inline:nn`
`\int_step_inline:nnn`
`\int_step_inline:nnnn`
`\int_step_variable:nNn`
`\int_step_variable:nnNn`
`\int_step_variable:nnnNn`
`__int_step:NNnnnn`

The approach here is to build a function, with a global integer required to make the nesting safe (as seen in other in line functions), and map that function using `\int_step_function:nnnN`. We put a `\prg_break_point:Nn` so that `map_break` functions from other modules correctly decrement `\g__kernel_pr_g_map_int` before looking for their own break point. The first argument is `\scan_stop:`, so that no breaking function recognizes this break point as its own.

```

18027 \cs_new_protected:Npn \int_step_inline:nn
18028 { \int_step_inline:nnnn { 1 } { 1 } }
18029 \cs_new_protected:Npn \int_step_inline:nnn #1
18030 { \int_step_inline:nnnn {#1} { 1 } }
18031 \cs_new_protected:Npn \int_step_inline:nnnn
18032 {
18033     \int_gincr:N \g__kernel_pr_g_map_int
18034     \exp_args:NNc \__int_step:NNnnnn
18035     \cs_gset_protected:Npn
18036         { __int_map \int_use:N \g__kernel_pr_g_map_int :w }
18037 }
18038 \cs_new_protected:Npn \int_step_variable:nNn
18039 { \int_step_variable:nnnNn { 1 } { 1 } }
18040 \cs_new_protected:Npn \int_step_variable:nnNn #1

```

```

18041 { \int_step_variable:nnnNn {#1} { 1 } }
18042 \cs_new_protected:Npn \int_step_variable:nnnNn #1#2#3#4#5
18043 {
18044   \int_gincr:N \g__kernel_prg_map_int
18045   \exp_args:Nnc \__int_step:NNnnnn
18046   \cs_gset_protected:Npe
18047   { __int_map_ \int_use:N \g__kernel_prg_map_int :w }
18048   {#1}{#2}{#3}
18049   {
18050     \tl_set:Nn \exp_not:N #4 {##1}
18051     \exp_not:n {#5}
18052   }
18053 }
18054 \cs_new_protected:Npn \__int_step:NNnnnn #1#2#3#4#5#6
18055 {
18056   #1 #2 ##1 {#6}
18057   \int_step_function:nnnN {#3} {#4} {#5} #2
18058   \prg_break_point:Nn \scan_stop: { \int_gdecr:N \g__kernel_prg_map_int }
18059 }

```

(End of definition for `\int_step_inline:nn` and others. These functions are documented on page 180.)

62.8 Formatting integers

`\int_to_arabic:n` Nothing exciting here.

```

\int_to_arabic:v 18060 \cs_new_eq:NN \int_to_arabic:n \int_eval:n
18061 \cs_generate_variant:Nn \int_to_arabic:n { v }

```

(End of definition for `\int_to_arabic:n`. This function is documented on page 181.)

`\int_to_symbols:nnn` For conversion of integers to arbitrary symbols the method is in general as follows. The input number (`#1`) is compared to the total number of symbols available at each place (`#2`). If the input is larger than the total number of symbols available then the modulus is needed, with one added so that the positions don't have to number from zero. Using an `f`-type expansion, this is done so that the system is recursive. The actual conversion function therefore gets a 'nice' number at each stage. Of course, if the initial input was small enough then there is no problem and everything is easy.

`__int_to_symbols:nnnn`
`__int_to_symbols:ennn`

```

18062 \cs_new:Npn \int_to_symbols:nnn #1#2#3
18063 {
18064   \int_compare:nNnTF {#1} > {#2}
18065   {
18066     \__int_to_symbols:ennn
18067     {
18068       \int_case:nn
18069       { 1 + \int_mod:nn { #1 - 1 } {#2} }
18070       {#3}
18071     }
18072     {#1} {#2} {#3}
18073   }
18074   { \int_case:nn {#1} {#3} }
18075 }
18076 \cs_new:Npn \__int_to_symbols:nnnn #1#2#3#4
18077 {

```

```

18078 \exp_args:Nf \int_to_symbols:nnn
18079 { \int_div_truncate:nn { #2 - 1 } {#3} } {#3} {#4}
18080 #1
18081 }
18082 \cs_generate_variant:Nn \__int_to_symbols:nnnn { e }

```

(End of definition for `\int_to_symbols:nnn` and `__int_to_symbols:nnnn`. This function is documented on page 182.)

`\int_to_alpha:n` These both use the above function with input functions that make sense for the alphabet
`\int_to_Alpha:n` in English.

```

18083 \cs_new:Npn \int_to_alpha:n #1
18084 {
18085   \int_to_symbols:nnn {#1} { 26 }
18086   {
18087     { 1 } { a }
18088     { 2 } { b }

18161   { __int_to_Base:nnN {#1} {#2} \c_empty_tl }
18162 }

```

Here, the idea is to provide a recursive system to deal with the input. The output is built up after the end of the function. At each pass, the value in `#1` is checked to see if it is less than the new base (`#2`). If it is, then it is converted directly, putting the sign back in front. On the other hand, if the value to convert is greater than or equal to the new base then the modulus and remainder values are found. The modulus is converted to a symbol and put on the right, and the remainder is carried forward to the next round.

18202 }

```

Convert to a letter only if necessary, otherwise simply return the value unchanged. It would be cleaner to use `\int_case:nn`, but in our case, the cases are contiguous, so it is forty times faster to use the `\if_case:w` primitive. The first `\exp_after:wN` expands the conditional, jumping to the correct case, the second one expands after the resulting character to close the conditional. Since `#1` might be an expression, and not directly a single digit, we need to evaluate it properly, and expand the trailing `\fi:`.

\int_to_roman:n The \__int_to_roman:w primitive creates tokens of category code 12 (other). Usually,
\int_to_Roman:n what is actually wanted is letters. The approach here is to convert the output of the
                  primitive into letters using appropriate control sequence names. That keeps everything
                  expandable. The loop is terminated by the conversion of the Q.

62.9 Converting from other formats to integers

`__int_pass_signs:wn` Called as `__int_pass_signs:wn <signs and digits> \s__int_stop {<code>}`, this function leaves in the input stream any sign it finds, then inserts the `<code>` before the first non-sign token (and removes `\s__int_stop`). More precisely, it deletes any + and passes any - to the input stream, hence should be called in an integer expression.

```

18313 \cs_new:Npn \__int_pass_signs:wn #1
18314 {
18315   \if:w + \if:w - \exp_not:N #1 + \fi: \exp_not:N #1
18316   \exp_after:wN \__int_pass_signs:wn
18317   \else:
18318     \exp_after:wN \__int_pass_signs_end:wn
18319     \exp_after:wN #1
18320   \fi:
18321 }
18322 \cs_new:Npn \__int_pass_signs_end:wn #1 \s__int_stop #2 { #2 #1 }

```

(End of definition for `__int_pass_signs:wn` and `__int_pass_signs_end:wn`.)

`\int_from_alph:n` First take care of signs then loop through the input using the recursion quarks. The `__int_from_alph:nN` auxiliary collects in its first argument the value obtained so far, and the auxiliary `__int_from_alph:N` converts one letter to an expression which evaluates to the correct number.

```

18323 \cs_new:Npn \int_from_alph:n #1
18324 {
18325   \int_eval:n
18326   {
18327     \exp_after:wN \__int_pass_signs:wn \tl_to_str:n {#1}
18328     \s__int_stop { \__int_from_alph:nN { 0 } }
18329     \q__int_recursion_tail \q__int_recursion_stop
18330   }
18331 }
18332 \cs_new:Npn \__int_from_alph:nN #1#2
18333 {
18334   \__int_if_recursion_tail_stop_do:Nn #2 {#1}
18335   \exp_args:Nf \__int_from_alph:nN
18336   { \int_eval:n { #1 * 26 + \__int_from_alph:N #2 } }
18337 }
18338 \cs_new:Npn \__int_from_alph:N #1
18339 { '#1 - \int_compare:nNnTF { '#1 } < { 91 } { 64 } { 96 } }

```

(End of definition for `\int_from_alph:n`, `__int_from_alph:nN`, and `__int_from_alph:N`. This function is documented on page 183.)

`\int_from_base:nn` Leave the signs into the integer expression, then loop through characters, collecting the value found so far in the first argument of `__int_from_base:nnN`. To convert a single character, `__int_from_base:N` checks first for digits, then distinguishes lower from

upper case letters, turning them into the appropriate number. Note that this auxiliary does not use `\int_eval:n`, hence is not safe for general use.

```

18340 \cs_new:Npn \int_from_base:nn #1#2
18341 {
18342   \int_eval:n
18343   {

62.10 Viewing integer

```

\int_show:N
\int_show:c
__int_show:nN

```

Diagnostics.

```

18418 \cs_new_eq:NN \int_show:N \__kernel_register_show:N
18419 \cs_generate_variant:Nn \int_show:N { c }

```

(End of definition for `\int_show:N` and `__int_show:nN`. This function is documented on page 184.)

\int_show:n We don't use the T_EX primitive `\showthe` to show integer expressions: this gives a more unified output.

```
18420 \cs_new_protected:Npn \int_show:n
18421 { \__kernel_msg_show_eval:Nn \int_eval:n }
```

(End of definition for \int_show:n. This function is documented on page 184.)

\int_log:N Diagnostics.

```
\int_log:c 18422 \cs_new_eq:NN \int_log:N \__kernel_register_log:N
18423 \cs_generate_variant:Nn \int_log:N { c }
```

(End of definition for \int_log:N. This function is documented on page 184.)

\int_log:n Similar to `\int_show:n`.

```
18424 \cs_new_protected:Npn \int_log:n
18425 { \__kernel_msg_log_eval:Nn \int_eval:n }
```

(End of definition for \int_log:n. This function is documented on page 184.)

62.11 Random integers

\int_rand:nn Defined in `l3fp-random`.

(End of definition for \int_rand:nn. This function is documented on page 184.)

62.12 Constant integers

\c_zero_int The zero is defined in `l3basics`.

```
\c_one_int 18426 \int_const:Nn \c_one_int { 1 }
```

(End of definition for \c_zero_int and \c_one_int. These variables are documented on page 184.)

\c_max_int The largest number allowed is $2^{31} - 1$

```
18427 \int_const:Nn \c_max_int { 2 147 483 647 }
```

(End of definition for \c_max_int. This variable is documented on page 185.)

\c_max_char_int The largest character code is 1114111 (hexadecimal 10FFFF) in X_ƎT_EX and LuaT_EX and 255 in other engines. In many places pT_EX and upT_EX support larger character codes but for instance the values of `\lccode` are restricted to $[0, 255]$.

```
18428 \int_const:Nn \c_max_char_int
18429 {
18430   \if_int_odd:w 0
18431     \cs_if_exist:NT \tex luatexversion:D { 1 }
18432     \cs_if_exist:NT \tex XeTeXversion:D { 1 } ~
18433     "10FFFF
18434   \else:
18435     "FF
18436   \fi:
18437 }
```

(End of definition for \c_max_char_int. This variable is documented on page 185.)

62.13 Scratch integers

`\l_tmpa_int` We provide two local and two global scratch counters, maybe we need more or less.
`\l_tmpb_int` 18438 \int_new:N \l_tmpa_int
`\g_tmpa_int` 18439 \int_new:N \l_tmpb_int
`\g_tmpb_int` 18440 \int_new:N \g_tmpa_int
18441 \int_new:N \g_tmpb_int

(End of definition for \l_tmpa_int and others. These variables are documented on page 185.)

62.14 Integers for earlier modules

<@@=seq>

`\l__int_internal_a_int`
`\l__int_internal_b_int` 18442 \int_new:N \l__int_internal_a_int
18443 \int_new:N \l__int_internal_b_int

(End of definition for \l__int_internal_a_int and \l__int_internal_b_int.)

18444 </code>

Chapter 63

l3flag implementation

```
18445 <*code>
18446 <@@=flag>
    The following test files are used for this code: m3flag001.
__flag_sep:
18447 \cs_new_eq:NN __flag_sep: \__kernel_int_sep:
    (End of definition for __flag_sep:.)
```

63.1 Protected flag commands

The height h of a flag (which is initially zero) is stored by setting control sequences of the form $\backslash\langle flag\ name\rangle\langle integer\rangle$ to $\backslash relax$ for $0 \leq \langle integer\rangle < h$. These control sequences are produced by $\backslash cs:w\langle flag\ var\rangle\langle integer\rangle\backslash cs_end:$, namely the $\langle flag\ var\rangle$ is actually a (protected) macro expanding to its own csname.

$\backslash flag_new:N$ Evaluate the csname of #1 for use in constructing the various indexed macros.

```
\flag_new:c
18448 \cs_new_protected:Npn \flag_new:N #1
18449 { \cs_new_protected:Npe #1 { \cs_to_str:N #1 } }
18450 \cs_generate_variant:Nn \flag_new:N { c }
```

(End of definition for $\backslash flag_new:N$. This function is documented on page 187.)

$\backslash l_tmpa_flag$ Two flag variables for scratch use.

```
\l_tmpb_flag
18451 \flag_new:N \l_tmpa_flag
18452 \flag_new:N \l_tmpb_flag
```

(End of definition for $\backslash l_tmpa_flag$ and $\backslash l_tmpb_flag$. These variables are documented on page 189.)

$\backslash flag_clear:N$ Undefine control sequences, starting from the 0 flag, upwards, until reaching an undefined control sequence. We don't use $\backslash cs_undefine:c$ because that would act globally.

```
\__flag_clear:wN
18453 \cs_new_protected:Npn \flag_clear:N #1
18454 {
18455     \__flag_clear:wN 0 \__flag_sep: #1
18456     \prg_break_point:
18457 }
18458 \cs_generate_variant:Nn \flag_clear:N { c }
```

```

18459 \cs_new_protected:Npn \__flag_clear:wN #1 \__flag_sep: #2
18460 {
18461   \if_cs_exist:w #2 #1 \cs_end: \else:
18462     \prg_break:n
18463   \fi:
18464   \cs_set_eq:cN { #2 #1 } \tex_undefined:D
18465   \exp_after:wN \__flag_clear:wN
18466   \int_value:w \int_eval:w \c_one_int + #1 \__flag_sep: #2
18467 }

```

(End of definition for `\flag_clear:N` and `__flag_clear:wN`. This function is documented on page 188.)

`\flag_clear_new:N` As for other datatypes, clear the `(flag var)` or create a new one, as appropriate.

```

\flag_clear_new:c 18468 \cs_new_protected:Npn \flag_clear_new:N #1
18469 { \flag_if_exist:NNTF #1 { \flag_clear:N } { \flag_new:N } #1 }
18470 \cs_generate_variant:Nn \flag_clear_new:N { c }

```

(End of definition for `\flag_clear_new:N`. This function is documented on page 188.)

`\flag_show:N` Show the height (terminal or log file) using appropriate `l3msg` auxiliaries.

```

\flag_show:c 18471 \cs_new_protected:Npn \flag_show:N { \__flag_show:NN \tl_show:n }
\flag_log:N 18472 \cs_generate_variant:Nn \flag_show:N { c }
\flag_log:c 18473 \cs_new_protected:Npn \flag_log:N { \__flag_show:NN \tl_log:n }
\__flag_show:NN 18474 \cs_generate_variant:Nn \flag_log:N { c }
18475 \cs_new_protected:Npn \__flag_show:NN #1#2
18476 {
18477   \__kernel_chk_defined:NT #2
18478   { \exp_args:Ne #1 { \tl_to_str:n { #2 height } = \flag_height:N #2 } }
18479 }

```

(End of definition for `\flag_show:N`, `\flag_log:N`, and `__flag_show:NN`. These functions are documented on page 188.)

63.2 Expandable flag commands

`\flag_if_exist_p:N` Copies of the `cs` functions defined in `l3basics`.

```

\flag_if_exist_p:c 18480 \prg_new_eq_conditional:Nnn \flag_if_exist:N \cs_if_exist:N
\flag_if_exist:NNTF 18481 { TF , T , F , p }
\flag_if_exist:cTF 18482 \prg_new_eq_conditional:Nnn \flag_if_exist:c \cs_if_exist:c
18483 { TF , T , F , p }

```

(End of definition for `\flag_if_exist:NNTF`. This function is documented on page 188.)

`\flag_if_raised_p:N` Test if the flag has a non-zero height, by checking the 0 control sequence.

```

\flag_if_raised_p:c 18484 \prg_new_conditional:Npnn \flag_if_raised:N #1 { p , T , F , TF }
\flag_if_raised:NNTF 18485 {
\flag_if_raised:cTF 18486   \if_cs_exist:w #1 0 \cs_end:
18487     \prg_return_true:
18488   \else:
18489     \prg_return_false:
18490   \fi:
18491 }
18492 \prg_generate_conditional_variant:Nnn \flag_if_raised:N
18493 { c } { p , T , F , TF }

```

(End of definition for `\flag_if_raised:NTF`. This function is documented on page 188.)

```

\flag_height:N Extract the value of the flag by going through all of the control sequences starting from
\flag_height:c 0.
\__flag_height_loop:wN 18494 \cs_new:Npn \flag_height:N #1 { \__flag_height_loop:wN 0 \__flag_sep: #1 }
\__flag_height_end:wN 18495 \cs_new:Npn \__flag_height_loop:wN #1 \__flag_sep: #2
18496 {
18497   \if_cs_exist:w #2 #1 \cs_end: \else:
18498     \exp_after:wN \__flag_height_end:wN
18499   \fi:
18500   \exp_after:wN \__flag_height_loop:wN
18501   \int_value:w \int_eval:w \c_one_int + #1 \__flag_sep: #2
18502 }
18503 \cs_new:Npn \__flag_height_end:wN #1 + #2 \__flag_sep: #3 {#2}
18504 \cs_generate_variant:Nn \flag_height:N { c }

```

(End of definition for `\flag_height:N`, `__flag_height_loop:wN`, and `__flag_height_end:wN`. This function is documented on page 188.)

```

\flag_raise:N Change the appropriate control sequence to \relax by expanding a \cs:w ... \cs_end:
\flag_raise:c construction, then pass it to \use_none:n to avoid leaving anything in the input stream.
18505 \cs_new:Npn \flag_raise:N #1
18506 { \exp_after:wN \use_none:n \cs:w #1 \flag_height:N #1 \cs_end: }
18507 \cs_generate_variant:Nn \flag_raise:N { c }

```

(End of definition for `\flag_raise:N`. This function is documented on page 188.)

```

\flag_ensure_raised:N Pass the control sequence with name <flag name>0 to \use_none:n. Constructing the
\flag_ensure_raised:c control sequence ensures that it changes from being undefined (if it was so) to being
\relax.

```

```

18508 \cs_new:Npn \flag_ensure_raised:N #1
18509 { \exp_after:wN \use_none:n \cs:w #1 0 \cs_end: }
18510 \cs_generate_variant:Nn \flag_ensure_raised:N { c }

```

(End of definition for `\flag_ensure_raised:N`. This function is documented on page 188.)

63.3 Old n-type flag commands

Here we keep the old flag commands since our policy is to no longer delete deprecated functions. The idea is to simply map `<flag name>` to `\l_<flag name>_flag`. When the debugging code is activated, it checks existence of the N-type flag variables that result.

```

\flag_new:n
\flag_clear:n 18511 \cs_new_protected:Npn \flag_new:n #1 { \flag_new:c { l_#1_flag } }
\flag_clear_new:n 18512 \cs_new_protected:Npn \flag_clear:n #1 { \flag_clear:c { l_#1_flag } }
\flag_if_exist_p:n 18513 \cs_new_protected:Npn \flag_clear_new:n #1 { \flag_clear_new:c { l_#1_flag } }
\flag_if_exist:nTF 18514 \cs_new:Npn \flag_if_exist_p:n #1 { \flag_if_exist_p:c { l_#1_flag } }
\flag_if_raised_p:n 18515 \cs_new:Npn \flag_if_exist:nTF #1 { \flag_if_exist:cT { l_#1_flag } }
\flag_if_raised:nTF 18516 \cs_new:Npn \flag_if_exist:nF #1 { \flag_if_exist:cF { l_#1_flag } }
\flag_height:n 18517 \cs_new:Npn \flag_if_exist:nTF #1 { \flag_if_exist:cTF { l_#1_flag } }
\flag_raise:n 18518 \cs_new:Npn \flag_if_raised_p:n #1 { \flag_if_raised_p:c { l_#1_flag } }
\flag_ensure_raised:n 18519 \cs_new:Npn \flag_if_raised:nT #1 { \flag_if_raised:cT { l_#1_flag } }
18520 \cs_new:Npn \flag_if_raised:nF #1 { \flag_if_raised:cF { l_#1_flag } }

```

```

18521 \cs_new:Npn \flag_if_raised:nTF #1 { \flag_if_raised:cTF { l_#1_flag } }
18522 \cs_new:Npn \flag_height:n #1 { \flag_height:c { l_#1_flag } }
18523 \cs_new:Npn \flag_raise:n #1 { \flag_raise:c { l_#1_flag } }
18524 \cs_new:Npn \flag_ensure_raised:n #1 { \flag_ensure_raised:c { l_#1_flag } }

```

(End of definition for \flag_new:n and others.)

```

\flag_show:n To avoid changing the output here we mostly keep the old code.
\flag_log:n
\__flag_show:Nn
18525 \cs_new_protected:Npn \flag_show:n { \__flag_show:Nn \tl_show:n }
18526 \cs_new_protected:Npn \flag_log:n { \__flag_show:Nn \tl_log:n }
18527 \cs_new_protected:Npn \__flag_show:Nn #1#2
18528 {
18529   \exp_args:Nc \__kernel_chk_defined:NT { l_#2_flag }
18530   {
18531     \exp_args:Ne #1
18532     { \tl_to_str:n { flag~#2~height } = \flag_height:n {#2} }
18533   }
18534 }

```

(End of definition for \flag_show:n, \flag_log:n, and __flag_show:Nn.)

```

18535 \</code>

```

Chapter 64

l3clist implementation

The following test files are used for this code: m3clist002.

```
18536 <*code>
18537 <@@=clist>
```

\c_empty_clist An empty comma list is simply an empty token list.

```
18538 \cs_new_eq:NN \c_empty_clist \c_empty_tl
```

(End of definition for \c_empty_clist. This variable is documented on page 200.)

\l__clist_internal_clist Scratch space for various internal uses. This comma list variable cannot be declared as such because it comes before \clist_new:N

```
18539 \tl_new:N \l__clist_internal_clist
```

(End of definition for \l__clist_internal_clist.)

\s__clist_mark Internal scan marks.

```
\s__clist_stop 18540 \scan_new:N \s__clist_mark
18541 \scan_new:N \s__clist_stop
```

(End of definition for \s__clist_mark and \s__clist_stop.)

__clist_use_none_delimit_by_s_mark:w Functions to gobble up to a scan mark.

```
\__clist_use_none_delimit_by_s_stop:w 18542 \cs_new:Npn \__clist_use_none_delimit_by_s_mark:w #1 \s__clist_mark { }
\__clist_use_i_delimit_by_s_stop:nw 18543 \cs_new:Npn \__clist_use_none_delimit_by_s_stop:w #1 \s__clist_stop { }
18544 \cs_new:Npn \__clist_use_i_delimit_by_s_stop:nw #1 #2 \s__clist_stop {#1}
```

(End of definition for __clist_use_none_delimit_by_s_mark:w, __clist_use_none_delimit_by_s_stop:w, and __clist_use_i_delimit_by_s_stop:nw.)

__clist_tmp:w A temporary function for various purposes.

```
18545 \cs_new_protected:Npn \__clist_tmp:w { }
```

(End of definition for __clist_tmp:w.)

64.1 Removing spaces around items

`__clist_trim_next:w` Called as `\exp:w __clist_trim_next:w \prg_do_nothing: <comma list> ...` it expands to `{<trimmed item>}` where the `<trimmed item>` is the first non-empty result from removing spaces from both ends of comma-delimited items in the `<comma list>`. The `\prg_do_nothing:` marker avoids losing braces. The test for blank items is a somewhat optimized `\tl_if_empty:oTF` construction; if blank, another item is sought, otherwise trim spaces.

```

18546 \cs_new:Npn \__clist_trim_next:w #1 ,
18547 {
18548   \tl_if_empty:oTF { \use_none:nn #1 ? }
18549   { \__clist_trim_next:w \prg_do_nothing: }
18550   { \tl_trim_spaces_apply:oN {#1} \exp_end: }
18551 }
```

(End of definition for `__clist_trim_next:w`.)

`__clist_sanitize:n` The auxiliary `__clist_sanitize:Nn` receives a delimiter (`\c_empty_tl` the first time, afterwards a comma) and that item as arguments. Unless we are done with the loop it calls `__clist_wrap_item:w` to unbrace the item (using a comma delimiter is safe since `#2` came from removing spaces from an argument delimited by a comma) and possibly re-brace it if needed.

`__clist_sanitize:Nn`

```

18552 \cs_new:Npn \__clist_sanitize:n #1
18553 {
18554   \exp_after:wN \__clist_sanitize:Nn \exp_after:wN \c_empty_tl
18555   \exp:w \__clist_trim_next:w \prg_do_nothing:
18556   #1 , \s__clist_stop \prg_break: , \prg_break_point:
18557 }
18558 \cs_new:Npn \__clist_sanitize:Nn #1#2
18559 {
18560   \__clist_use_none_delimit_by_s_stop:w #2 \s__clist_stop
18561   #1 \__clist_wrap_item:w #2 ,
18562   \exp_after:wN \__clist_sanitize:Nn \exp_after:wN ,
18563   \exp:w \__clist_trim_next:w \prg_do_nothing:
18564 }
```

(End of definition for `__clist_sanitize:n` and `__clist_sanitize:Nn`.)

`__clist_if_wrap:nTF` True if the argument must be wrapped to avoid getting altered by some clist operations.
`__clist_if_wrap:w` That is the case whenever the argument

- starts or end with a space or contains a comma,
- is empty, or
- consists of a single braced group.

If the argument starts or ends with a space or contains a comma then one of the three arguments of `__clist_if_wrap:w` will have its end delimiter (partly) in one of the three copies of `#1` in `__clist_if_wrap:nTF`; this has a knock-on effect meaning that the result of the expansion is not empty; in that case, wrap. Otherwise, the argument is safe unless it starts with a brace group (or is empty) and it is empty or consists of a single n-type argument.

```

18565 \prg_new_conditional:Npnn \__clist_if_wrap:n #1 { TF }
```

```

18566 {
18567   \tl_if_empty:oTF
18568   {
18569     \__clist_if_wrap:w
18570     \s__clist_mark ? #1 ~ \s__clist_mark ? ~ #1
18571     \s__clist_mark , ~ \s__clist_mark #1 ,
18572   }
18573   {
18574     \tl_if_head_is_group:nTF { #1 { } }
18575     {
18576       \tl_if_empty:nTF {#1}
18577       { \prg_return_true: }
18578       {
18579         \tl_if_empty:oTF { \use_none:n #1}
18580         { \prg_return_true: }
18581         { \prg_return_false: }
18582       }
18583     }
18584     { \prg_return_false: }
18585   }
18586   { \prg_return_true: }
18587 }
18588 \cs_new:Npn \__clist_if_wrap:w #1 \s__clist_mark ? ~ #2 ~ \s__clist_mark #3 , { }

```

(End of definition for __clist_if_wrap:nTF and __clist_if_wrap:w.)

__clist_wrap_item:w Safe items are put in \exp_not:n, otherwise we put an extra set of braces.

```

18589 \cs_new:Npn \__clist_wrap_item:w #1 ,
18590 { \__clist_if_wrap:nTF {#1} { \exp_not:n { {#1} } } { \exp_not:n {#1} } }

```

(End of definition for __clist_wrap_item:w.)

64.2 Allocation and initialisation

\clist_new:N Internally, comma lists are just token lists.

```

\clist_new:c 18591 \cs_new_eq:NN \clist_new:N \tl_new:N
18592 \cs_new_eq:NN \clist_new:c \tl_new:c

```

(End of definition for \clist_new:N. This function is documented on page 191.)

\clist_const:Nn Creating and initializing a constant comma list is done by sanitizing all items (stripping spaces and braces).

```

\clist_const:Nx 18593 \cs_new_protected:Npn \clist_const:Nn #1#2
\clist_const:cn 18594 { \tl_const:Ne #1 { \__clist_sanitize:n {#2} } }
\clist_const:ce 18595 \cs_generate_variant:Nn \clist_const:Nn { Ne , c , ce }
\clist_const:cx 18596 \cs_generate_variant:Nn \clist_const:Nn { Nx , cx }

```

(End of definition for \clist_const:Nn. This function is documented on page 191.)

\clist_clear:N Clearing comma lists is just the same as clearing token lists.

```

\clist_clear:c 18597 \cs_new_eq:NN \clist_clear:N \tl_clear:N
\clist_gclear:N 18598 \cs_new_eq:NN \clist_clear:c \tl_clear:c
\clist_gclear:c 18599 \cs_new_eq:NN \clist_gclear:N \tl_gclear:N
18600 \cs_new_eq:NN \clist_gclear:c \tl_gclear:c

```

(End of definition for `\clist_clear:N` and `\clist_gclear:N`. These functions are documented on page 191.)

```
\clist_clear_new:N Once again a copy from the token list functions.
\clist_clear_new:c 18601 \cs_new_eq:NN \clist_clear_new:N \tl_clear_new:N
\clist_gclear_new:N 18602 \cs_new_eq:NN \clist_clear_new:c \tl_clear_new:c
\clist_gclear_new:c 18603 \cs_new_eq:NN \clist_gclear_new:N \tl_gclear_new:N
18604 \cs_new_eq:NN \clist_gclear_new:c \tl_gclear_new:c
```

(End of definition for `\clist_clear_new:N` and `\clist_gclear_new:N`. These functions are documented on page 191.)

```
\clist_set_eq:NN Once again, these are simple copies from the token list functions.
\clist_set_eq:cN 18605 \cs_new_eq:NN \clist_set_eq:NN \tl_set_eq:NN
\clist_set_eq:Nc 18606 \cs_new_eq:NN \clist_set_eq:Nc \tl_set_eq:Nc
\clist_set_eq:cc 18607 \cs_new_eq:NN \clist_set_eq:cN \tl_set_eq:cN
\clist_gset_eq:NN 18608 \cs_new_eq:NN \clist_set_eq:cc \tl_set_eq:cc
\clist_gset_eq:cN 18609 \cs_new_eq:NN \clist_gset_eq:NN \tl_gset_eq:NN
\clist_gset_eq:Nc 18610 \cs_new_eq:NN \clist_gset_eq:Nc \tl_gset_eq:Nc
\clist_gset_eq:cN 18611 \cs_new_eq:NN \clist_gset_eq:cN \tl_gset_eq:cN
18612 \cs_new_eq:NN \clist_gset_eq:cc \tl_gset_eq:cc
```

(End of definition for `\clist_set_eq:NN` and `\clist_gset_eq:NN`. These functions are documented on page 191.)

```
\clist_set_from_seq:NN Setting a comma list from a comma-separated list is done using a simple mapping. Safe
\clist_set_from_seq:cN items are put in \exp_not:n, otherwise we put an extra set of braces. The first comma
\clist_set_from_seq:Nc must be removed, except in the case of an empty comma-list.
\clist_set_from_seq:cc 18613 \cs_new_protected:Npn \clist_set_from_seq:NN
\clist_gset_from_seq:NN 18614 { \__clist_set_from_seq:NNNN \clist_clear:N \__kernel_tl_set:Nx }
\clist_gset_from_seq:cN 18615 \cs_new_protected:Npn \clist_gset_from_seq:NN
\clist_gset_from_seq:Nc 18616 { \__clist_set_from_seq:NNNN \clist_gclear:N \__kernel_tl_gset:Nx }
\clist_gset_from_seq:cc 18617 \cs_new_protected:Npn \__clist_set_from_seq:NNNN #1#2#3#4
\__clist_set_from_seq:NNNN 18618 {

64.4 Comma lists as stacks

Getting an item from the left of a comma list is pretty easy: just trim off the first item using the comma. No need to trim spaces as comma-list *variables* are assumed to have “cleaned-up” items. (Note that grabbing a comma-delimited item removes an outer pair of braces if present, exactly as needed to uncover the underlying item.)

```

18697 \cs_new_protected:Npn \clist_get:NN #1#2
18698 {
18699     \if_meaning:w #1 \c_empty_clist
18700     \tl_set:Nn #2 { \q_no_value }
18701     \else:
18702         \exp_after:wN \__clist_get:wN #1 , \s__clist_stop #2
18703     \fi:
18704 }
18705 \cs_new_protected:Npn \__clist_get:wN #1 , #2 \s__clist_stop #3
18706 { \tl_set:Nn #3 {#1} }
18707 \cs_generate_variant:Nn \clist_get:NN { c }

```

(End of definition for `\clist_get:NN` and `__clist_get:wN`. This function is documented on page 198.)

`\clist_pop:NN` An empty clist leads to `\q_no_value`, otherwise grab until the first comma and assign to the variable. The second argument of `__clist_pop:wwNNN` is a comma list ending in a comma and `\s__clist_mark`, unless the original clist contained exactly one item: then the argument is just `\s__clist_mark`. The next auxiliary picks either `\exp_not:n` or `\use_none:n` as #2, ensuring that the result can safely be an empty comma list.

```

18708 \cs_new_protected:Npn \clist_pop:NN
18709   { \__clist_pop:NNN \__kernel_tl_set:Nx }
18710 \cs_new_protected:Npn \clist_gpop:NN

\clist_gremove_all:cV
\clist_gremove_all:Ne
\clist_gremove_all:ce
__clist_remove_all:NNNn
__clist_remove_all:w
__clist_remove_all:

```

The method used here for safe items is very similar to `\tl_replace_all:Nnn`. However, if the item contains commas or leading/trailing spaces, or is empty, or consists of a single brace group, we know that it can only appear within braces so the code would fail; instead just convert to a sequence and do the removal with `l3seq` code (it involves somewhat elaborate code to do most of the work expandably but the final token list comparisons non-expandably).

For “safe” items, build a function delimited by the `<item>` that should be removed, surrounded with commas, and call that function followed by the expanded comma list, and another copy of the `<item>`. The loop is controlled by the argument grabbed by `__clist_remove_all:w`: when the item was found, the `\s__clist_mark` delimiter used is the one inserted by `__clist_tmp:w`, and `__clist_use_none_delimit_by_s_stop:w` is deleted. At the end, the final `<item>` is grabbed, and the argument of `__clist_tmp:w` contains `\s__clist_mark`: in that case, `__clist_remove_all:w` removes the second `\s__clist_mark` (inserted by `__clist_tmp:w`), and lets `__clist_use_none_delimit_by_s_stop:w` act.

No brace is lost because items are always grabbed with a leading comma. The result of the first assignment has an extra leading comma, which we remove in a second assignment. Two exceptions: if the clist lost all of its elements, the result is empty, and we shouldn’t remove anything; if the clist started up empty, the first step happens to turn it into a single comma, and the second step removes it.

```

```

(End of definition for `\clist_remove_all:Nn` and others. These functions are documented on page 193.)

`\clist_reverse:N` Use `\clist_reverse:n` in an e-expanding assignment. The extra work that `\clist_reverse:n` does to preserve braces and spaces would not be needed for the well-controlled case of N-type comma lists, but the slow-down is not too bad.

```

\clist_reverse:c
\clist_greverse:N
\clist_greverse:c
18826 \cs_new_protected:Npn \clist_reverse:N #1
18827   { \__kernel_tl_set:Nx #1 { \exp_args:No \clist_reverse:n {#1} } }
18828 \cs_new_protected:Npn \clist_greverse:N #1
18829   { \__kernel_tl_gset:Nx #1 { \exp_args:No \clist_reverse:n {#1} } }
18830 \cs_generate_variant:Nn \clist_reverse:N { c }
18831 \cs_generate_variant:Nn \clist_greverse:N { c }

```

(End of definition for `\clist_reverse:N` and `\clist_greverse:N`. These functions are documented on page 193.)

`\clist_reverse:n` The reversed token list is built one item at a time, and stored between `\s__clist_stop` and `\s__clist_mark`, in the form of ? followed by zero or more instances of “`<item>`,”. We start from a comma list “`<item1>, ..., <itemn>`”. During the loop, the auxiliary `__clist_reverse:wwNww` receives “`?<itemi>`” as #1, “`<itemi+1>, ..., <itemn>`” as #2, `__clist_reverse:wwNww` as #3, what remains until `\s__clist_stop` as #4, and “`<itemi-1>, ..., <item1>`,” as #5. The auxiliary moves #1 just before #5, with a comma, and calls itself (#3). After the last item is moved, `__clist_reverse:wwNww` receives “`\s__clist_mark __clist_reverse:wwNww !`” as its argument #1, thus `__clist_reverse_end:ww` as its argument #3. This second auxiliary cleans up until the marker !, removes the trailing comma (introduced when the first item was moved after `\s__clist_stop`), and leaves its argument #1 within `\exp_not:n`. There is also a need to remove a leading comma, hence `\exp_not:o` and `\use_none:n`.

```

18832 \cs_new:Npn \clist_reverse:n #1
18833   {
18834     \__clist_reverse:wwNww ? #1 ,
18835     \s__clist_mark \__clist_reverse:wwNww ! ,
18836     \s__clist_mark \__clist_reverse_end:ww
18837     \s__clist_stop ? \s__clist_mark
18838   }
18839 \cs_new:Npn \__clist_reverse:wwNww
18840   #1 , #2 \s__clist_mark #3 #4 \s__clist_stop ? #5 \s__clist_mark
18841   { #3 ? #2 \s__clist_mark #3 #4 \s__clist_stop #1 , #5 \s__clist_mark }
18842 \cs_new:Npn \__clist_reverse_end:ww #1 ! #2 , \s__clist_mark
18843   { \exp_not:o { \use_none:n #2 } }

```

(End of definition for `\clist_reverse:n`, `__clist_reverse:wwNww`, and `__clist_reverse_end:ww`. This function is documented on page 193.)

`\clist_sort:Nn` Implemented in `l3sort`.

64.7 Mapping over comma lists

`\clist_map_function:NN` If the variable is empty, the mapping is skipped (otherwise, that comma-list would be seen as consisting of one empty item). Then loop over the comma-list, grabbing eight comma-delimited items at a time. The end is marked by `\s__clist_stop`, which may not appear in any of the items. Once the last group of eight items has been reached, we go through them more slowly using `__clist_map_function_end:w`. The auxiliary function `__clist_map_function:Nw` is also used in some other clist mappings.

```

18899 \cs_new:Npn \clist_map_function:NN #1#2
18900 {
18901     \clist_if_empty:NF #1
18902     {
18903         \exp_after:wN \__clist_map_function:Nw \exp_after:wN #2 #1 ,

```

(End of definition for `\clist_map_function:NN`, `__clist_map_function:Nw`, and `__clist_map_function_end:w`. This function is documented on page 195.)

`\clist_map_function:nN` The `n`-type mapping function is a bit more awkward, since spaces must be trimmed from each item. Space trimming is again based on `__clist_trim_next:w`. The auxiliary `__clist_map_function_n:Nn` receives as arguments the function, and the next non-empty item (after space trimming but before brace removal). One level of braces is removed by `__clist_map_unbrace:wn`.

```

18923 \cs_new:Npn \clist_map_function:nN #1#2

```

(End of definition for `\clist_map_function:nN`, `__clist_map_function_n:Nn`, and `__clist_map_unbrace:wn`. This function is documented on page 195.)

`\clist_map_inline:Nn` `\clist_map_inline:cn` `\clist_map_inline:nn` Inline mapping is done by creating a suitable function “on the fly”: this is done globally to avoid any issues with TeX’s groups. We use a different function for each level of nesting.

Since the mapping is non-expandable, we can perform the space-trimming needed by the `n` version simply by storing the comma-list in a variable. We don’t need a different comma-list for each nesting level: the comma-list is expanded before the mapping starts.

```

18939 \cs_new_protected:Npn \clist_map_inline:Nn #1#2

```

(End of definition for `\clist_map_inline:Nn` and `\clist_map_inline:nn`. These functions are documented on page 195.)

`\clist_map_variable:NNn` The N-type version is a straightforward application of `\clist_map_tokens:Nn`, calling `__clist_map_variable:Nnn` for each item to assign the variable and run the user's code. The n-type version is *not* implemented in terms of the n-type function `\clist_map_tokens:Nn`, because here we are allowed to clean up the n-type comma list non-expandably.

```

```

(End of definition for `\clist_map_tokens:nn` and `__clist_map_tokens_n:nw`. This function is documented on page 195.)

`\clist_map_break:` The break statements use the general `\prg_map_break:Nn` mechanism.
`\clist_map_break:n`

```

19012   \cs_new:Npn \clist_map_break:
19013   { \prg_map_break:Nn \clist_map_break: { } }
19014   \cs_new:Npn \clist_map_break:n
19015   { \prg_map_break:Nn \clist_map_break: }

```

(End of definition for `\clist_map_break:` and `\clist_map_break:n`. These functions are documented on page 195.)

`\clist_count:N` Counting the items in a comma list is done using the same approach as for other token
`\clist_count:c` count functions: turn each entry into a +1 then use integer evaluation to actually do the
`\clist_count:n` mathematics. In the case of an n-type comma-list, we could of course use `\clist_map_`
`\clist_count:e` `function:nN`, but that is very slow, because it carefully removes spaces. Instead, we loop
`__clist_count:n` manually, and skip blank items (but not `{}`, hence the extra spaces).
`__clist_count:w`

```

19016   \cs_new:Npn \clist_count:N #1
19017   {
19018     \int_eval:n

19040   \tl_if_blank:nF {##1} { + 1 }
19041   \__clist_count:w #1
19042 }
19043 }
19044 \exp_args:No \__clist_tmp:w \c_space_tl
19045 \cs_generate_variant:Nn \clist_count:n { e }

```

(End of definition for `\clist_count:N` and others. These functions are documented on page 196.)

64.8 Using comma lists

```

\clist_use:Nnnn
\clist_use:cnnn
\__clist_use:wwn
\__clist_use:nwwwnwn
\__clist_use:nwwn
\clist_use:Nn
\clist_use:cn

```

First check that the variable exists. Then count the items in the comma list. If it has none, output nothing. If it has one item, output that item, brace stripped (note that space-trimming has already been done when the comma list was assigned). If it has two, place the *<separator between two>* in the middle.

Otherwise, `__clist_use:nwwwnwn` takes the following arguments; 1: a *<separator>*, 2, 3, 4: three items from the comma list (or quarks), 5: the rest of the comma list, 6: a *<continuation>* function (`use_ii` or `use_iii` with its *<separator>* argument), 7: junk, and 8: the temporary result, which is built in a brace group following `\s__clist_stop`. The *<separator>* and the first of the three items are placed in the result, then we use the *<continuation>*, placing the remaining two items after it. When we begin this loop, the three items really belong to the comma list, the first `\s__clist_mark` is taken as a delimiter to the `use_ii` function, and the continuation is `use_ii` itself. When we reach the last two items of the original token list, `\s__clist_mark` is taken as a third item, and now the second `\s__clist_mark` serves as a delimiter to `use_ii`, switching to the other *<continuation>*, `use_iii`, which uses the *<separator between final two>*.

```

\clist_use:nnnn

\clist_use:nn

__clist_use:Nw

__clist_use_one:w

__clist_use_end:w

__clist_use_more:w

Items are grabbed by __clist_use:Nw, which detects blank items with a \tl_if_empty:oTF test (in which case it recurses). Non-blank items are either the end of the list, in which case the argument #1 of __clist_use:Nw is used to properly end the list, or are normal items, which must be trimmed and properly unbraced. As we find successive items, the long list of __clist_use:Nw calls gets shortened and we end up calling __clist_use_more:w once we have found 3 items. This auxiliary leaves the first-found item and the general separator, and calls __clist_use:Nw to find more items. A subtlety is that we use __clist_use_end:w both in the case of a two-item list and for the last two items of a general list: to get the correct separator, __clist_use_more:w replaces the separator-of-two by the last-separator when called, namely as soon as we have found three items.

```

19081 \cs_new:Npn \clist_use:nnnn #1#2#3#4

(End of definition for `\clist_use:nnnn` and others. These functions are documented on page 198.)

64.9 Using a single item

`\clist_item:Nn` To avoid needing to test the end of the list at each step, we first compute the $\langle length \rangle$ of the list. If the item number is 0, less than $-\langle length \rangle$, or more than $\langle length \rangle$, the result is empty. If it is negative, but not less than $-\langle length \rangle$, add $\langle length \rangle + 1$ to the item number before performing the loop. The loop itself is very simple, return the item if the counter reached 1, otherwise, decrease the counter and repeat.

```

```

\clist_rand_item:n The N-type function is not implemented through the n-type function for efficiency: for
\clist_rand_item:N instance comma-list variables do not require space-trimming of their items. Even testing
\clist_rand_item:c for emptiness of an n-type comma-list is slow, so we count items first and use that both
\__clist_rand_item:nn for the emptiness test and the pseudo-random integer. Importantly, \clist_item:Nn
and \clist_item:nn only evaluate their argument once.
19174 \cs_new:Npn \clist_rand_item:n #1

```

(End of definition for `\char_set_mathcode:nn` and others. These functions are documented on page 205.)

`\l_char_active_seq` Two sequences for dealing with special characters. The first is characters which may be active, the second longer list is for “special” characters more generally. Both lists are escaped so that for example bulk code assignments can be carried out. In both cases, the order is by ASCII character code (as is done in for example `\ExplSyntaxOn`).

```

19320 \seq_new:N \l_char_special_seq
19321 \seq_set_split:Nnn \l_char_special_seq { }

```

```

19322 { \ \ " \# \$ \% \& \ \ ^ \_ \{ \} \~ }
19323 \seq_new:N \l_char_active_seq
19324 \seq_set_split:Nnn \l_char_active_seq { }
19325 { \ " \$ & ^ _ \~ }

```

(End of definition for `\l_char_active_seq` and `\l_char_special_seq`. These variables are documented on page 206.)

65.3 Creating character tokens

`\char_set_active_eq:NN` Four simple functions with very similar definitions, so set up using an auxiliary. These are similar to LuaTeX's `\letcharcode` primitive.

```

\char_set_active_eq:Nc
\char_gset_active_eq:NN
\char_gset_active_eq:Nc
\char_set_active_eq:nN
\char_set_active_eq:nc
\char_gset_active_eq:nN
\char_gset_active_eq:nc
19326 \group_begin:
19327   \char_set_catcode_active:N \^^@
19328   \cs_set_protected:Npn \__char_tmp:nN #1#2
19329   {
19330     \cs_new_protected:cpn { #1 :nN } ##1
19331     {
19332       \group_begin:
19333       \char_set_lccode:nn { '^^@ } { ##1 }
19334       \tex_lowercase:D { \group_end: #2 ^^@ }
19335     }
19336     \cs_new_protected:cpe { #1 :NN } ##1
19337     { \exp_not:c { #1 : nN } { '##1 } }
19338   }
19339   \__char_tmp:nN { char_set_active_eq } \cs_set_eq:NN
19340   \__char_tmp:nN { char_gset_active_eq } \cs_gset_eq:NN
19341 \group_end:
19342 \cs_generate_variant:Nn \char_set_active_eq:NN { Nc }
19343 \cs_generate_variant:Nn \char_gset_active_eq:NN { Nc }
19344 \cs_generate_variant:Nn \char_set_active_eq:nN { nc }
19345 \cs_generate_variant:Nn \char_gset_active_eq:nN { nc }

```

(End of definition for `\char_set_active_eq:NN` and others. These functions are documented on page 202.)

`__char_int_to_roman:w` For efficiency in 8-bit engines, we use the faster primitive approach to making roman numerals.

```

19346 \cs_new_eq:NN \__char_int_to_roman:w \tex_romannumeral:D

```

(End of definition for `__char_int_to_roman:w`.)

`__char_sep:`

```

19347 \cs_new_eq:NN \__char_sep: \__kernel_int_sep:

```

(End of definition for `__char_sep:`.)

`\char_generate:nn` The aim here is to generate characters of (broadly) arbitrary category code. Where possible, that is done using engine support (XeTeX, LuaTeX). There are though various issues which are covered below. At the interface layer, turn the two arguments into integers up-front so this is only done once.

```

\__char_generate_aux:nn
\__char_generate_aux:nnw
\__char_generate_auxii:nnw
  \l__char_tmp_tl
\__char_generate_invalid_catcode:
19348 \cs_new:Npn \char_generate:nn #1#2
19349 {
19350   \exp:w \exp_after:wN \__char_generate_aux:w

```

```

19351     \int_value:w \int_eval:n {#1} \exp_after:wN \__char_sep:
19352     \int_value:w \int_eval:n {#2} \__char_sep:
19353 }

```

Before doing any actual conversion, first some special case filtering. Spaces are out here as LuaTeX emulation only makes normal (charcode 32 spaces). However, \sim is filtered out separately as that can't be done with macro emulation either, so is treated separately. That done, hand off to the engine-dependent part.

```

19354 \cs_new:Npn \__char_generate_aux:w #1 \__char_sep: #2 \__char_sep:
19355 {
19356   \if_int_odd:w 0
19357     \if_int_compare:w #2 < 1 \exp_stop_f: 1 \fi:
19358     \if_int_compare:w #2 = 5 \exp_stop_f: 1 \fi:
19359     \if_int_compare:w #2 = 9 \exp_stop_f: 1 \fi:
19360     \if_int_compare:w #2 > 13 \exp_stop_f: 1 \fi: \exp_stop_f:
19361     \msg_expandable_error:nn { char }
19362     { invalid-catcode }
19363   \else:
19364     \if_int_odd:w 0
19365       \if_int_compare:w #1 < \c_zero_int 1 \fi:
19366       \if_int_compare:w #1 > \c_max_char_int 1 \fi: \exp_stop_f:
19367       \msg_expandable_error:nn { char }
19368       { out-of-range }
19369     \else:
19370       \if_int_compare:w #2#1 = 100 \exp_stop_f:
19371       \msg_expandable_error:nn { char } { null-space }
19372     \else:
19373       \__char_generate_aux:nnw {#1} {#2}
19374     \fi:
19375   \fi:
19376 \fi:
19377 \exp_end:
19378 }
19379 \tl_new:N \l__char_tmp_tl

```

Engine-dependent definitions are now needed for the implementation. Recent (u)pTeX and the Unicode engines LuaTeX and XeTeX have engine-level support for expandable character creation. pdfTeX and older (u)pTeX releases do not. The branching here is low-level to avoid fixing the category code of the null character used in the false branch. The final level is the basic definition at the engine level: the arguments here are integers so there is no need to worry about them too much. Older versions of XeTeX cannot generate active characters so we filter that: at some future stage that may change: the slightly odd ordering of auxiliaries reflects that.

```

19380 \group_begin:
19381   \char_set_catcode_active:N \^^L
19382   \cs_set:Npn ^^L { }
19383   \if_cs_exist:N \tex_Ucharcat:D
19384     \cs_new:Npn \__char_generate_aux:nnw #1#2#3 \exp_end:
19385     {
19386       #3
19387       \exp_after:wN \exp_end:
19388       \tex_Ucharcat:D #1 \exp_stop_f: #2 \exp_stop_f:
19389     }
19390   \else:

```

For engines where `\Ucharcat` isn't available or emulated, we have to work in macros, and cover only the 8-bit range. The first stage is to build up a `\tl` containing `^^@` with each category code that can be accessed in this way, with an error set up for the other cases. This is all done such that it can be quickly accessed using a `\if_case:w` low-level conditional. The list is done in reverse as this puts the case of an active token *first*: that's needed to cover the possibility that it is `\outer`. Getting the braces into the list is done using some standard `\if_false:` manipulation, while all of the `\exp_not:N` are required as there is an expansion in the setup.

```

19391 \char_set_catcode_active:n { 0 }
19392 \tl_set:Nn \l__char_tmp_tl { \exp_not:N ^^@ \exp_not:N \or: }
19393 \char_set_catcode_other:n { 0 }
19394 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }
19395 \char_set_catcode_letter:n { 0 }
19396 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }

```

For making spaces, there needs to be an o-type expansion of a `\use:n` (or some other tokenization) to avoid dropping the space.

```

19397 \tl_put_right:Nn \l__char_tmp_tl { \use:n { ~ } \exp_not:N \or: }
19398 \tl_put_right:Nn \l__char_tmp_tl { \exp_not:N \or: }
19399 \char_set_catcode_math_subscript:n { 0 }
19400 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }
19401 \char_set_catcode_math_superscript:n { 0 }
19402 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }
19403 \char_set_catcode_parameter:n { 0 }
19404 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }
19405 \tl_put_right:Nn \l__char_tmp_tl { { \if_false: } \fi: \exp_not:N \or: }
19406 \char_set_catcode_alignment:n { 0 }
19407 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }
19408 \char_set_catcode_math_toggle:n { 0 }
19409 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: }
19410 \char_set_catcode_group_end:n { 0 }
19411 \tl_put_right:Nn \l__char_tmp_tl { \if_false: { \fi: ^^@ \exp_not:N \or: } % }
19412 \char_set_catcode_group_begin:n { 0 } % {
19413 \tl_put_right:Nn \l__char_tmp_tl { ^^@ \exp_not:N \or: } }

```

Convert the above temporary list into a series of constant token lists, one for each character code, using `\tex_lowercase:D` to convert `^^@` in each case. The e-type expansion ensures that `\tex_lowercase:D` receives the contents of the token list.

```

19414 \cs_set_protected:Npn \__char_tmp:n #1
19415 {
19416 \char_set_lccode:nn { 0 } {#1}
19417 \char_set_lccode:nn { 32 } {#1}
19418 \exp_args:Ne \tex_lowercase:D
19419 {
19420 \tl_const:Ne
19421 \exp_not:c { c__char_ \__char_int_to_roman:w #1 _tl }
19422 { \exp_not:o \l__char_tmp_tl }
19423 }
19424 }
19425 \int_step_function:nnN { 0 } { 255 } \__char_tmp:n

```

As \TeX is very unhappy if it finds an alignment character inside a primitive `\halign` even when skipping false branches, some precautions are required. \TeX is happy if the token is hidden between braces within `\if_false: ... \fi:`. The rather low-level approach here

expands in one step to the $\langle target\ token \rangle$ (`\or: ...`), then `\exp_after:wN $\langle target\ token \rangle$ (\or: ...)` expands in one step to $\langle target\ token \rangle$. This means that `\exp_not:N` is applied to a potentially-problematic active token.

```

19426 \cs_new:Npn \__char_generate_aux:nnw #1#2#3 \exp_end:
19427 {
19428     #3
19429     \if_false: { \fi:
19430         \exp_after:wN \exp_after:wN \exp_after:wN \exp_end:
19431         \exp_after:wN \exp_after:wN
19432         \if_case:w \tex_numexpr:D 13 - #2
19433             \exp_after:wN \exp_after:wN \exp_after:wN \exp_after:wN

19438     \fi:
19439 }
19440 \fi:
19441 \group_end:

```

(End of definition for `\char_generate:nn` and others. This function is documented on page 202.)

`\c_catcode_active_tl`

While `\char_generate:nn` can produce active characters in some engines it cannot in general. It would be possible to simply change the catcode of space but then the code would need to avoid all spaces, making it quite unreadable. Instead we use the primitive `\tex_lowercase:D` trick.

```

19442 \group_begin:
19443 \char_set_catcode_active:N *
19444 \char_set_lccode:nn { '*' } { '\ }
19445 \tex_lowercase:D { \tl_const:Nn \c_catcode_active_space_tl { * } }
19446 \group_end:

```

(End of definition for `\c_catcode_active_space_tl`. This variable is documented on page 202.)

`\c_catcode_other_space_tl`

Create a space with category code 12: an “other” space.

```

19447 \tl_const:Nc \c_catcode_other_space_tl { \char_generate:nn { '\ } { 12 } }

```

(End of definition for `\c_catcode_other_space_tl`. This function is documented on page 203.)

65.4 Generic tokens

```

19448 <@@=token>

```

`\s__token_mark` Internal scan marks.

```

\s__token_stop
19449 \scan_new:N \s__token_mark
19450 \scan_new:N \s__token_stop

```

(End of definition for `\s__token_mark` and `\s__token_stop`.)

`\token_to_meaning:N`

These are all defined in `l3basics`, as they are needed “early”. This is just a reminder!

`\token_to_meaning:c`

`\token_to_str:N`

`\token_to_str:c`

(End of definition for `\token_to_meaning:N` and `\token_to_str:N`. These functions are documented on page 207.)

`\token_to_catcode:N` The macro works by comparing the input token with `\if_catcode:w` with all valid category codes. Since the most common tokens in an average argument list are of category 11 or 12 those are tested first. And since a space and braces are no ordinary N-type arguments, and only control sequences let to those categories can match them they are tested last.

```

19451 \cs_new:Npn \token_to_catcode:N

```

\c_group_begin_token We define these useful tokens. For the brace and space tokens things have to be done
\c_group_end_token by hand: the formal argument spec. for \cs_new_eq:NN does not cover them so we do
\c_math_toggle_token things by hand. (As currently coded it would work with \cs_new_eq:NN but that's not
\c_alignment_token really a great idea to show off: we want people to stick to the defined interfaces and that
\c_parameter_token includes us.) So that these few odd names go into the log when appropriate there is a
\c_math_superscript_token need to hand-apply the \__kernel_chk_if_free_cs:N check.
\c_math_subscript_token

65.5 Token conditionals

`\token_if_group_begin_p:N` Check if token is a begin group token. We use the constant `\c_group_begin_token` for this.

`\token_if_group_begin:NTF`

```

19521 \prg_new_conditional:Npnn \token_if_group_begin:N #1 { p , T , F , TF }
19522 {
19523 \if_catcode:w \exp_not:N #1 \c_group_begin_token
19524 \prg_return_true: \else: \prg_return_false: \fi:
19525 }

```

(End of definition for `\token_if_group_begin:N`. This function is documented on page 207.)

`\token_if_group_end_p:N` Check if token is a end group token. We use the constant `\c_group_end_token` for this.

`\token_if_group_end:NTF`

```

19526 \prg_new_conditional:Npnn \token_if_group_end:N #1 { p , T , F , TF }
19527 {

```

```

19528     \if_catcode:w \exp_not:N #1 \c_group_end_token
19529     \prg_return_true: \else: \prg_return_false: \fi:
19530   }

```

(End of definition for `\token_if_group_end:NTF`. This function is documented on page 207.)

`\token_if_math_toggle_p:N` Check if token is a math shift token. We use the constant `\c_math_toggle_token` for this.

`\token_if_math_toggle:NTF`

```

19531 \prg_new_conditional:Npnn \token_if_math_toggle:N #1 { p , T , F , TF }
19532 {
19533     \if_catcode:w \exp_not:N #1 \c_math_toggle_token
19534     \prg_return_true: \else: \prg_return_false: \fi:
19535 }

```

(End of definition for `\token_if_math_toggle:NTF`. This function is documented on page 208.)

`\token_if_alignment_p:N` Check if token is an alignment tab token. We use the constant `\c_alignment_token` for this.

`\token_if_alignment:NTF`

```

19536 \prg_new_conditional:Npnn \token_if_alignment:N #1 { p , T , F , TF }
19537 {
19538     \if_catcode:w \exp_not:N #1 \c_alignment_token
19539     \prg_return_true: \else: \prg_return_false: \fi:
19540 }

```

(End of definition for `\token_if_alignment:NTF`. This function is documented on page 208.)

`\token_if_parameter_p:N` Check if token is a parameter token. We use the constant `\c_parameter_token` for this.

`\token_if_parameter:NTF`

We have to trick TeX a bit to avoid an error message: within a group we prevent `\c_parameter_token` from behaving like a macro parameter character. The definitions of `\prg_new_conditional:Npnn` are global, so they remain after the group.

```

19541 \group_begin:
19542 \cs_set_eq:NN \c_parameter_token \scan_stop:
19543 \prg_new_conditional:Npnn \token_if_parameter:N #1 { p , T , F , TF }
19544 {
19545     \if_catcode:w \exp_not:N #1 \c_parameter_token
19546     \prg_return_true: \else: \prg_return_false: \fi:
19547 }
19548 \group_end:

```

(End of definition for `\token_if_parameter:NTF`. This function is documented on page 208.)

`\token_if_math_superscript_p:N` Check if token is a math superscript token. We use the constant `\c_math_superscript_token` for this.

`\token_if_math_superscript:NTF`

```

19549 \prg_new_conditional:Npnn \token_if_math_superscript:N #1
19550 { p , T , F , TF }
19551 {
19552     \if_catcode:w \exp_not:N #1 \c_math_superscript_token
19553     \prg_return_true: \else: \prg_return_false: \fi:
19554 }

```

(End of definition for `\token_if_math_superscript:NTF`. This function is documented on page 208.)

`\token_if_math_subscript_p:N` Check if token is a math subscript token. We use the constant `\c_math_subscript_token` for this.
`\token_if_math_subscript:NTF`

```
19555 \prg_new_conditional:Npnn \token_if_math_subscript:N #1 { p , T , F , TF }
19556 {
19557     \if_catcode:w \exp_not:N #1 \c_math_subscript_token
19558     \prg_return_true: \else: \prg_return_false: \fi:
19559 }
```

(End of definition for `\token_if_math_subscript:NTF`. This function is documented on page 208.)

`\token_if_space_p:N` Check if token is a space token. We use the constant `\c_space_token` for this.
`\token_if_space:NTF`

```
19560 \prg_new_conditional:Npnn \token_if_space:N #1 { p , T , F , TF }
19561 {
19562     \if_catcode:w \exp_not:N #1 \c_space_token
19563     \prg_return_true: \else: \prg_return_false: \fi:
19564 }
```

(End of definition for `\token_if_space:NTF`. This function is documented on page 208.)

`\token_if_letter_p:N` Check if token is a letter token. We use the constant `\c_catcode_letter_token` for this.
`\token_if_letter:NTF`

```
19565 \prg_new_conditional:Npnn \token_if_letter:N #1 { p , T , F , TF }
19566 {
19567     \if_catcode:w \exp_not:N #1 \c_catcode_letter_token
19568     \prg_return_true: \else: \prg_return_false: \fi:
19569 }
```

(End of definition for `\token_if_letter:NTF`. This function is documented on page 208.)

`\token_if_other_p:N` Check if token is an other char token. We use the constant `\c_catcode_other_token` for this.
`\token_if_other:NTF`

```
19570 \prg_new_conditional:Npnn \token_if_other:N #1 { p , T , F , TF }
19571 {
19572     \if_catcode:w \exp_not:N #1 \c_catcode_other_token
19573     \prg_return_true: \else: \prg_return_false: \fi:
19574 }
```

(End of definition for `\token_if_other:NTF`. This function is documented on page 208.)

`\token_if_active_p:N` Check if token is an active char token. We use the constant `\c_token_active_tl` for this. A technical point is that `\c__token_active_tl` is in fact a macro expanding to `\exp_not:N *`, where `*` is active.
`\token_if_active:NTF`

```
19575 \prg_new_conditional:Npnn \token_if_active:N #1 { p , T , F , TF }
19576 {
19577     \if_catcode:w \exp_not:N #1 \c__token_active_tl
19578     \prg_return_true: \else: \prg_return_false: \fi:
19579 }
```

(End of definition for `\token_if_active:NTF`. This function is documented on page 208.)

`\token_if_eq_meaning_p:NN` Check if the tokens #1 and #2 have same meaning.
`\token_if_eq_meaning:NNTF`

```
19580 \prg_new_eq_conditional:NNn \token_if_eq_meaning:NN \cs_if_eq:NN
19581 { p , T , F , TF }
```

(End of definition for `\token_if_eq_meaning:NNTF`. This function is documented on page 209.)

`\token_if_eq_catcode_p:NN` Check if the tokens #1 and #2 have same category code.
`\token_if_eq_catcode:NNTF`

```

19582 \prg_new_conditional:Npnn \token_if_eq_catcode:NN #1#2 { p , T , F , TF }
19583 {
19584     \if_catcode:w \exp_not:N #1 \exp_not:N #2
19585     \prg_return_true: \else: \prg_return_false: \fi:
19586 }

```

(End of definition for `\token_if_eq_catcode:NNTF`. This function is documented on page 208.)

`\token_if_eq_charcode_p:NN` Check if the tokens #1 and #2 have same character code.
`\token_if_eq_charcode:NNTF`

```

19587 \prg_new_conditional:Npnn \token_if_eq_charcode:NN #1#2 { p , T , F , TF }
19588 {
19589     \if_charcode:w \exp_not:N #1 \exp_not:N #2
19590     \prg_return_true: \else: \prg_return_false: \fi:
19591 }

```

(End of definition for `\token_if_eq_charcode:NNTF`. This function is documented on page 209.)

`\token_if_macro_p:N` When a token is a macro, `\token_to_meaning:N` always outputs something like
`\token_if_macro:NNTF` `\long macro:#1->#1` so we could naively check to see if the meaning contains `->`.
`__token_if_macro_p:w` However, this can fail the five `\...mark` primitives, whose meaning has the form
`\...mark:<user material>`. The problem is that the `<user material>` can contain `->`.

However, only characters, macros, and marks can contain the colon character. The idea is thus to grab until the first `:`, and analyse what is left. However, macros can have any combination of `\long`, `\protected` or `\outer` (not used in L^AT_EX3) before the string `macro:.` We thus only select the part of the meaning between the first `ma` and the first following `:`. If this string is `cro`, then we have a macro. If the string is `rk`, then we have a mark. The string can also be `cro parameter character` for a colon with a weird category code (namely the usual category code of `#`). Otherwise, it is empty.

This relies on the fact that `\long`, `\protected`, `\outer` cannot contain `ma`, regardless of the escape character, even if the escape character is `m...`

Both `ma` and `:` must be of category code 12 (other), so are detokenized.

```

19592 \use:e
19593 {
19594     \prg_new_conditional:Npnn \exp_not:N \token_if_macro:N #1
19595     { p , T , F , TF }
19596     {
19597         \exp_not:N \exp_after:wN \exp_not:N \__token_if_macro_p:w
19598         \exp_not:N \token_to_meaning:N #1 \tl_to_str:n { ma : }
19599         \s__token_stop
19600     }
19601     \cs_new:Npn \exp_not:N \__token_if_macro_p:w
19602     #1 \tl_to_str:n { ma } #2 \c_colon_str #3 \s__token_stop
19603 }
19604 {
19605     \str_if_eq:nnTF { #2 } { cro }
19606     { \prg_return_true: }
19607     { \prg_return_false: }
19608 }

```

(End of definition for `\token_if_macro:NNTF` and `__token_if_macro_p:w`. This function is documented on page 209.)

`\token_if_cs_p:N` Check if token has same catcode as a control sequence. This follows the same pattern as
`\token_if_cs:NTF` for `\token_if_letter:N` etc. We use `\scan_stop:` for this.

```

19609 \prg_new_conditional:Npnn \token_if_cs:N #1 { p , T , F , TF }
19610 {
19611     \if_catcode:w \exp_not:N #1 \scan_stop:
19612     \prg_return_true: \else: \prg_return_false: \fi:
19613 }

```

(End of definition for `\token_if_cs:NTF`. This function is documented on page 209.)

`\token_if_expandable_p:N` Check if token is expandable. We use the fact that T_EX temporarily converts `\exp_not:N` $\langle token \rangle$ into `\scan_stop:` if $\langle token \rangle$ is expandable. An undefined token is not considered as expandable. No problem nesting the conditionals, since the third #1 is only skipped if it is non-expandable (hence not part of T_EX’s conditional apparatus).

`\token_if_expandable:NTF`

```

19614 \prg_new_conditional:Npnn \token_if_expandable:N #1 { p , T , F , TF }
19615 {
19616     \exp_after:wN \if_meaning:w \exp_not:N #1 #1
19617     \prg_return_false:
19618     \else:
19619         \if_cs_exist:N #1
19620         \prg_return_true:
19621     \else:
19622         \prg_return_false:
19623     \fi:
19624 \fi:
19625 }

```

(End of definition for `\token_if_expandable:NTF`. This function is documented on page 209.)

`__token_delimit_by_char:w` These auxiliary functions are used below to define some conditionals which detect whether
`__token_delimit_by_count:w` the `\meaning` of their argument begins with a particular string. Each auxiliary takes an
`__token_delimit_by_dimen:w` argument delimited by a string, a second one delimited by `\s__token_stop`, and returns
`__token_delimit_by_font:w` the first one and its delimiter. This result is eventually compared to another string. Note
`__token_delimit_by_macro:w` that the “font” auxiliary is delimited by a space followed by “font”. This avoids an
`__token_delimit_by_muskip:w` unnecessary check for the `\font` primitive below.
`__token_delimit_by_skip:w`
`__token_delimit_by_toks:w`

```

19626 \group_begin:
19627 \cs_set_protected:Npn \__token_tmp:w #1
19628 {
19629     \use:e
19630     {

19643 \__token_tmp:w { toks }
19644 \group_end:

```

(End of definition for `__token_delimit_by_char:w` and others.)

Each of these conditionals tests whether its argument's `\meaning` starts with a given string. This is essentially done by having an auxiliary grab an argument delimited by the string and testing whether the argument was empty. Of course, a copy of this string must first be added to the end of the `\meaning` to avoid a runaway argument in case it does not contain the string. Two complications arise. First, the escape character is not fixed, and cannot be included in the delimiter of the auxiliary function (this function cannot be defined on the fly because tests must remain expandable): instead the first argument of the auxiliary (plus the delimiter to avoid complications with trailing spaces) is compared using `\str_if_eq:eeTF` to the result of applying `\token_to_str:N` to a control sequence. Second, the `\meaning` of primitives such as `\dimen` or `\dimendef` starts in the same way as registers such as `\dimen123`, so they must be tested for.

Characters used as delimiters must have catcode 12 and are obtained through `\tl_to_str:n`. This requires doing all definitions within `e`-expansion. The temporary function `__token_tmp:w` used to define each conditional receives three arguments: the name of the conditional, the auxiliary's delimiter (also used to name the auxiliary), and the string to which one compares the auxiliary's result. Note that the `\meaning` of a protected long macro starts with `\protected\long macro`, with no space after `\protected` but a space after `\long`, hence the mixture of `\token_to_str:N` and `\tl_to_str:n`.

For the first six conditionals, `\cs_if_exist:cT` turns out to be `false` (thanks to the leading space for `font`), and the code boils down to a string comparison between the result of the auxiliary on the `\meaning` of the conditional's argument `####1`, and `#3`. Both are evaluated at run-time, as this is important to get the correct escape character.

The other five conditionals have additional code that compares the argument `####1` to two `TeX` primitives which would wrongly be recognized as registers otherwise. Despite using `TeX`'s primitive conditional construction, this does not break when `####1` is itself a conditional, because branches of the conditionals are only skipped if `####1` is one of the two primitives that are tested for (which are not `TeX` conditionals).

(End of definition for `\token_if_chardef:N` and others. These functions are documented on page 209.)

`\token_if_primitive_p:N`

`\token_if_primitive:N`

We filter out macros first, because they cause endless trouble later otherwise.

Primitives are almost distinguished by the fact that the result of `\token_to_meaning:N` is formed from letters only. Every other token has either a space (e.g., the letter A), a digit (e.g., `\count123`) or a double quote (e.g., `\char"A`).

Ten exceptions: on the one hand, `\tex_undefined:D` is not a primitive, but its meaning is undefined, only letters; on the other hand, `\space`, `\italiccorr`, `\hyphen`, `\firstmark`, `\topmark`, `\botmark`, `\splitfirstmark`, `\splitbotmark`, and `\nullfont` are primitives, but have non-letters in their meaning.

We start by removing the two first (non-space) characters from the meaning. This removes the escape character (which may be nonexistent depending on `\endlinechar`), and takes care of three of the exceptions: `\space`, `\italiccorr` and `\hyphen`, whose meaning is at most two characters. This leaves a string terminated by some `:`, and `\s_token_stop`.

The meaning of each one of the five `\...mark` primitives has the form `<letters>:<user material>`. In other words, the first non-letter is a colon. We remove everything after the first colon.

We are now left with a string, which we must analyze. For primitives, it contains only letters. For non-primitives, it contains either `"`, or a space, or a digit. Two exceptions remain: `\tex_undefined:D`, which is not a primitive, and `\nullfont`, which is a primitive.

Spaces cannot be grabbed in an undelimited way, so we check them separately. If there is a space, we test for `\nullfont`. Otherwise, we go through characters one by one, and stop at the first character less than ‘A’ (this is not quite a test for “only letters”,

but is close enough to work in this context). If this first character is : then we have a primitive, or `\tex_undefined:D`, and if it is " or a digit, then the token is not a primitive.

For LuaTeX we use a different implementation which just looks at the command code for the token and compares it to a list of non-primitives. Again, `\nullfont` is a special case because it is the only primitive with the normally non-primitive `set_font` command code.

In LuaMetaTeX some of the command names are different, so we check for both versions. The first one is always the LuaTeX version.

```

The aim here is to allow the case statement to be evaluated using a known number of expansion steps (two), and without needing to use an explicit “end of recursion” marker. That is achieved by using the test input as the final case, as this is always true. The trick is then to tidy up the output such that the appropriate case code plus either the true or false branch code is inserted.

```

To tidy up the recursion, there are two outcomes. If there was a hit to one of the cases searched for, then **#1** is the code to insert, **#2** is the *next* case to check on and **#3** is all of the rest of the cases code. That means that **#4** is the **true** branch code, and **#5** tidies up the spare `\s__token_mark` and the **false** branch. On the other hand, if none of the cases matched then we arrive here using the “termination” case of comparing the search with itself. That means that **#1** is empty, **#2** is the first `\s__token_mark` and so **#4** is the **false** code (the **true** code is mopped up by **#3**).

65.6 Peeking ahead at the next token

```

19865 <@@=peek>

```

Peeking ahead is implemented using a two part mechanism. The outer level provides a defined interface to the lower level material. This allows a large amount of code to be shared. There are four cases:

1. peek at the next token;
2. peek at the next non-space token;
3. peek at the next token and remove it;
4. peek at the next non-space token and remove it.

\l_peek_token Storage tokens which are publicly documented: the token peeked.
\g_peek_token

```

19866 \cs_new_eq:NN \l_peek_token ?
19867 \cs_new_eq:NN \g_peek_token ?

```

(End of definition for \l_peek_token and \g_peek_token. These variables are documented on page 211.)

\l__peek_search_token The token to search for as an implicit token: cf. \l__peek_search_tl.

```

19868 \cs_new_eq:NN \l__peek_search_token ?

```

(End of definition for \l__peek_search_token.)

\l__peek_search_tl The token to search for as an explicit token: cf. \l__peek_search_token.

```

19897   \else:
19898     \group_align_safe_end:
19899     \exp_after:wN \__peek_false:w
19900   \fi:
19901 }

```

(End of definition for `\peek_remove_spaces:n` and `__peek_remove_spaces:`. This function is documented on page 212.)

`\peek_remove_filler:n` Here we expand the input, removing spaces and `\scan_stop:` tokens until we reach a non-expandable token. At that stage we re-insert the payload. To deal with the problem of `&` tokens, we have to put the align-safe group in the correct place.

```

\__peek_remove_filler:w
\__peek_remove_filler:
  \__peek_remove_filler_expand:w
19902 \cs_new_protected:Npn \peek_remove_filler:n #1
19903 {
19904   \cs_set:Npn \__peek_true_aux:w { \__peek_remove_filler:w }
19905   \cs_set:Npe \__peek_false:w
19906   {
19907     \exp_not:N \group_align_safe_end:
19908     \exp_not:n {#1}
19909   }
19910   \group_align_safe_begin:
19911   \__peek_remove_filler:w
19912 }
19913 \cs_new_protected:Npn \__peek_remove_filler:w
19914 {
19915   \exp_after:wN \peek_after:Nw \exp_after:wN \__peek_remove_filler:
19916   \exp:w \exp_end_continue_f:w
19917 }

```

Here we can nest conditionals as `\l_peek_token` is only skipped over in the nested one if it's a space: no problems with conditionals or outer tokens.

```

19918 \cs_new_protected:Npn \__peek_remove_filler:
19919 {
19920   \if_catcode:w \exp_not:N \l_peek_token \c_space_token
19921     \exp_after:wN \__peek_true_remove:w

19938     \fi:
19939 }

```

(End of definition for `\peek_remove_filler:n` and others. This function is documented on page 213.)

`__peek_token_generic_aux:NNNTF`

The generic functions store the test token in both implicit and explicit modes, and the **true** and **false** code as token lists, more or less. The two branches have to be absorbed here as the input stream needs to be cleared for the peek function itself. Here, #1 is `__peek_true_remove:w` when removing the token and `__peek_true_aux:w` otherwise.

```

19940 \cs_new_protected:Npn \__peek_token_generic_aux:NNNTF #1#2#3#4#5
19941 {
19942     \group_align_safe_begin:

19967 { \__peek_token_remove_generic:NNTF #1 #2 {#3} { } }

```

```

19968 \cs_new_protected:Npn \__peek_token_remove_generic:NNTF #1#2#3
19969 { \__peek_token_remove_generic:NNTF #1 #2 { } {#3} }

```

(End of definition for __peek_token_remove_generic:NNTF and __peek_token_remove_generic:NNTF.)

__peek_execute_branches_meaning: The meaning test is straight forward.

```

19970 \cs_new:Npn \__peek_execute_branches_meaning:
19971 {
19972   \if_meaning:w \l_peek_token \l_peek_search_token
19973   \exp_after:wN \__peek_true:w
19974   \else:
19975     \exp_after:wN \__peek_false:w
19976   \fi:
19977 }

```

(End of definition for __peek_execute_branches_meaning:.)

__peek_execute_branches_catcode: The catcode and charcode tests are very similar, and in order to use the same auxiliaries we do something a little bit odd, firing \if_catcode:w and \if_charcode:w before finding the operands for those tests, which are only given in the auxii:N and auxiii:N auxiliaries. For our purposes, three kinds of tokens may follow the peeking function:

- control sequences which are not equal to a non-active character token (*e.g.*, macro, primitive);
- active characters which are not equal to a non-active character token (*e.g.*, macro, primitive);
- explicit non-active character tokens, or control sequences or active characters set equal to a non-active character token.

The first two cases are not distinguishable simply using TeX's \futurelet, because we can only access the \meaning of tokens in that way. In those cases, detected thanks to a comparison with \scan_stop:, we grab the following token, and compare it explicitly with the explicit search token stored in \l_peek_search_tl. The \exp_not:N prevents outer macros (coming from non-L^AT_EX3 code) from blowing up. In the third case, \l_peek_token is good enough for the test, and we compare it again with the explicit search token. Just like the peek token, the search token may be of any of the three types above, hence the need to use the explicit token that was given to the peek function.

```

20022         }
20023     }
20024 }

```

(End of definition for \peek_catcode:N~~TF~~ and others. These functions are documented on page 212.)

\peek_N_type:TF All tokens are N-type tokens, except in four cases: begin-group tokens, end-group tokens, space tokens with character code 32, and outer tokens. Since **\l_peek_token** might be outer, we cannot use the convenient **\bool_if:nTF** function, and must resort to the old trick of using **\ifodd** to expand a set of tests. The **false** branch of this test is taken if the token is one of the first three kinds of non-N-type tokens (explicit or implicit), thus we call **__peek_false:w**. In the **true** branch, we must detect outer tokens, without impacting performance too much for non-outer tokens. The first filter is to search for **outer** in the **\meaning** of **\l_peek_token**. If that is absent, **__peek_use_none_delimit_by_s_stop:w** cleans up, and we call **__peek_true:w**. Otherwise, the token can be a non-outer macro or a primitive mark whose parameter or replacement text contains **outer**, it can be the primitive **\outer**, or it can be an outer token. Macros and marks would have

ma in the part before the first occurrence of `outer`; the meaning of `\outer` has nothing after `outer`, contrarily to `outer` macros; and that covers all cases, calling `__peek_true:w` or `__peek_false:w` as appropriate. Here, there is no `<search token>`, so we feed a dummy `\scan_stop:` to the `__peek_token_generic:NNTF` function.

```

Chapter 66

l3prop implementation

The following test files are used for this code: m3prop001, m3prop002, m3prop003, m3prop004, m3show001.

```
20067 <*code>
20068 <@@=prop>
```

With the (default) flat data storage, a property list is a macro whose top-level expansion is of the form

```
\s__prop \__prop_chk:w \__prop_pair:wn <key1> \s__prop {<value1>}
...
\__prop_pair:wn <keyn> \s__prop {<valuen>}
```

where `\s__prop` is a scan mark (equal to `\scan_stop:`), `__prop_chk:w` produces a suitable error if the property list is used directly in the input stream, and `__prop_pair:wn` can be used to map through the property list.

With the linked data storage, each property list entry `<keyi>–<valuei>` is stored into a token list `__prop <prefix> <keyi>`. The `<prefix>` is one or more characters (no spaces), constructed automatically only once, when the property list is initially declared. The control sequence name does not conform to standard naming for variables because (1) this is an internal control sequence, not really a `expl3` variable; (2) keeping track of the scope `l` or `g` throughout all functions would be a pretty big mess, especially if users accidentally mix local and global use (we would have to always check for such mistakes, rather than only checking when suitable debug options are set); (3) shorter control sequence names use less memory and are quicker in case of hash collisions, which may matter since we are using many control sequences.

We need to enable mapping through such a property list, but without storing a list of all entries anywhere: this is achieved by making each of these token lists also store a pointer to the next entry. To enable efficient deletion, the token lists also store a pointer to the previous entry. This means we have a doubly-linked list. To avoid having to special-case the two ends of the doubly-linked list when deleting entries, we include as a zeroth entry in the doubly-linked list the property list variable itself, and we include as an $(n + 1)$ -th entry in the doubly-linked list an end-pointer `__prop <prefix>` (no trailing space, so it differs from an empty key). The space before `<prefix>` ensures there is no collision with other `l3prop` internal functions, even if we have very many linked property lists being defined.

The property list variable itself is a token list of the form

```
\__prop_flatten:w \__prop <prefix> \s__prop {\<prefix>} \__prop <prefix> <key1>
```

Here, `__prop_flatten:w` serves as an efficiently recognized marker, and when `f`-expanded it is tasked with fully unpacking the property list into the same form as the default data storage so as to ease conversion. The `<prefix>` is used when looking up an entry. The token list `__prop <prefix>` (see below) contains a pointer to the last key to help insert a new entry. The pointer to `<key1>` is needed to start a mapping. The token list labeled by `<keyi>` is of the form

```
\use_none:n \__prop <prefix> <keyi-1> \__prop_pair:wn <keyi> \s__-
prop {\<valuei>} \__prop <prefix> <keyi+1>
```

where the pointer to `<keyi-1>` is needed when deleting the `<keyi>`. Expanding this will run `__prop_pair:wn` on the `<keyi>`–`<valuei>` pair (for speed, `<keyi>` is kept as explicit tokens rather than slowly extracting it from a control sequence name), then move on to the next key, thus mapping through the whole list. The mapping is ended upon expanding `__prop <prefix>`, which is the token list

```
\use_none:n \__prop <prefix> <keyn>
```

Let us think about deleting the `<keyi>`. We need to update the `<keyi-1>` and `<keyi+1>` to point to each other instead of `<keyi>`. To edit the corresponding token lists, it is important that `__prop <prefix> <keyi>` be at the “same place” in the token lists also in the boundary cases $i = 1$ or $i = n$, namely as the second token, or as the second argument after `\s__prop`.

66.1 Internal auxiliaries

`__prop_tmp:w` Scratch macro, defined as needed, for instance to save `__prop_pair:wn` when concatenating.

```
20069 \cs_new_eq:NN \__prop_tmp:w ?
```

(End of definition for `__prop_tmp:w`.)

`\l__prop_internal_tl` Token list used in various places: for the prefix; when converting from flat to linked props; and to store the new key–value pair inserted by `\prop_put:Nnn`.

```
20070 \tl_new:N \l__prop_internal_tl
```

(End of definition for `\l__prop_internal_tl`.)

`\s__prop_mark` Internal scan marks.

```
\s__prop_stop 20071 \scan_new:N \s__prop_mark
```

```
20072 \scan_new:N \s__prop_stop
```

(End of definition for `\s__prop_mark` and `\s__prop_stop`.)

`\q__prop_recursion_tail` Internal recursion quarks.

```
\q__prop_recursion_stop 20073 \quark_new:N \q__prop_recursion_tail
```

```
20074 \quark_new:N \q__prop_recursion_stop
```

(End of definition for `\q__prop_recursion_tail` and `\q__prop_recursion_stop`.)

```

\__prop_if_recursion_tail_stop:n Functions to query recursion quarks.
\__prop_if_recursion_tail_stop:o
20075 \__kernel_quark_new_test:N \__prop_if_recursion_tail_stop:n
20076 \cs_generate_variant:Nn \__prop_if_recursion_tail_stop:n { o }

(End of definition for \__prop_if_recursion_tail_stop:n and \__prop_if_recursion_tail_stop:o.)

```

66.2 Structure of a property list

`\s__prop` A private scan mark is used as a marker after each key, and at the very beginning of the property list.

```
20077 \scan_new:N \s__prop
```

(End of definition for `\s__prop`.)

`__prop_chk:w` This removes the flat property list from the input stream and complains about a bad use of a property list. Since property lists do not have an end-marker, we slowly peek ahead in a loop. Speed does not matter since this is for an error situation. While `__prop_pair:wn` does not keep a fixed definition, it always includes the internal `\s__prop` in its argument specification, so that there is no risk of accidentally picking up a public token instead of `__prop_pair:wn` when doing a meaning test. We collect the keys and values to produce a more useful error message.

```

20078 \cs_new_protected:Npn \__prop_chk:w { \__prop_chk_loop:nw { } }
20079 \cs_new_protected:Npn \__prop_chk_loop:nw #1
20080 {
20081   \peek_meaning:NTF \__prop_pair:wn
20082   { \__prop_chk_get:nw {#1} }
20083   { \msg_error:nne { prop } { misused } {#1} }
20084 }
20085 \cs_new_protected:Npn \__prop_chk_get:nw #1 \__prop_pair:wn #2 \s__prop #3
20086 { \__prop_chk_loop:nw { #1 , ~ {#2} = { \tl_to_str:n {#3} } } }

```

(End of definition for `__prop_chk:w`, `__prop_chk_loop:nw`, and `__prop_chk_get:nw`.)

`__prop_pair:wn` Used as `__prop_pair:wn <key> \s__prop {<item>}` for both storage types, this internal token starts each key–value pair in the property list. This default definition is changed globally by any mapping function, so there is not much point trying to make it an error. Instead, the error is produced by `__prop_chk:w`.

```
20087 \cs_new:Npn \__prop_pair:wn #1 \s__prop #2 { }
```

(End of definition for `__prop_pair:wn`.)

`__prop_flatten:w` We implement here the fact that f-expanding a linked property list gives a flat property list. Leaving a linked property list in the input stream will turn it into a flat property list so that the error implemented by `__prop_chk:w` will correctly be triggered.

```

20088 \cs_new_protected:Npn \__prop_flatten:w #1 \s__prop #2#3
20089 { \use:e { \__prop_flatten_aux:N #3 } }

```

(End of definition for `__prop_flatten:w`.)

`__prop_flatten:N` The main function `__prop_flatten:N` receives a linked property list and flattens it.
`__prop_flatten_aux:w` The auxiliary `__prop_flatten_aux:N` receives a pointer to the first key and flattens
`__prop_flatten_aux:N` the linked property list into a flat property list. This is only restricted-expandable
`__prop_flatten_loop:w` as it involves mapping through all of the property list's entries starting from $\langle key_1 \rangle$.
The looping function `__prop_flatten_loop:w` removes `use_none:n` and a backwards
pointer #2, leaves the key-value pair for `use:e` to receive, and calls itself again after
expanding the next key's token list. Its argument #3 is empty, except at the end where
it is the `use_none:nnnn` appearing in the definition of `__prop_flatten_aux:N`, which
ends the loop.

```

20090 \cs_new:Npn __prop_flatten:N #1
20091 { \exp_after:wN __prop_flatten_aux:w #1 }
20092 \cs_new:Npn __prop_flatten_aux:w #1 \s__prop #2 { __prop_flatten_aux:N }
20093 \cs_new:Npn __prop_flatten_aux:N #1
20094 {
20095   \s__prop __prop_chk:w
20096   \exp_after:wN __prop_flatten_loop:w #1
20097   \use_none:nnnn __prop_pair:wn \s__prop { }
20098 }
20099 \cs_new:Npn __prop_flatten_loop:w #1#2#3 __prop_pair:wn #4 \s__prop #5
20100 {
20101   #3
20102   \exp_not:n { __prop_pair:wn #4 \s__prop {#5} }
20103   \exp_after:wN __prop_flatten_loop:w
20104 }

```

(End of definition for `__prop_flatten:N` and others.)

`g__prop_prefix_int` Used to assign prefixes for each linked property list. It is converted to base `c__prop_`
`c__prop_basis_int` `basis_int`, then each digit is converted to a character, starting at ! (the character after
space).

```

20105 \int_new:N g__prop_prefix_int
20106 \int_const:Nn c__prop_basis_int { \c_max_char_int - '!' }

```

(End of definition for `g__prop_prefix_int` and `c__prop_basis_int`.)

`__prop_next_prefix:` Store in `l__prop_internal_tl` the conversion of `g__prop_prefix_int` to characters,
`__prop_to_prefix:n` and increment this integer for use in the next linked property list. No need to optimize
since this is only used when declaring the property list the first time. The aim here is to
make this string as short as we can, given the range of distinct characters available. This
speeds up the work of `cs:w ... cs_end:` that looks up keys in the hash table.

```

20107 \cs_new_protected:Npn __prop_next_prefix:
20108 {
20109   \tl_set:Nc l__prop_internal_tl
20110   { __prop_to_prefix:n { g__prop_prefix_int } }
20111   \int_gincr:N g__prop_prefix_int
20112 }
20113 \cs_new:Npn __prop_to_prefix:n #1
20114 {
20115   \int_compare:nNnTF {#1} > c__prop_basis_int
20116   {
20117     \exp_args:Nf __prop_to_prefix:n
20118     { \int_div_truncate:nn {#1} c__prop_basis_int }
20119     \exp_args:Nf __prop_to_prefix:n

```

```

20120         { \int_mod:nn {#1} \c__prop_basis_int }
20121     }
20122     { \char_generate:nn { '\! + #1 } { 12 } }
20123 }

```

(End of definition for `__prop_next_prefix:` and `__prop_to_prefix:n`.)

`__prop_if_flat:N`
`__prop_if_flat_aux:w`

We could either test for the presence of `__prop_chk:w` (flat property list) or of `__prop_flatten:w` (linked property list). We make the second choice; this way props that are accidentally `\relax` are treated as they were before. The auxiliary receives `\use_i:nn` or `\use_ii:nn` as #3. As a transitional fix we avoid erroring in case the prop is undefined (the `\exp_after:wN` is omitted in that case, taking the flat branch).

```

20124 \cs_new:Npn \__prop_if_flat:NTF #1
20125 {
20126     \prop_if_exist:NT #1
20127     \exp_after:wN \__prop_if_flat_aux:w #1
20128     \s__prop_mark \use_ii:nn
20129     \__prop_flatten:w \s__prop_mark \use_i:nn \s__prop_stop
20130 }
20131 \cs_new:Npn \__prop_if_flat_aux:w
20132     #1 \__prop_flatten:w #2 \s__prop_mark #3 #4 \s__prop_stop {#3}

```

(End of definition for `__prop_if_flat:N` and `__prop_if_flat_aux:w`.)

66.3 Allocation and initialisation

`\c_empty_prop`

An empty flat prop.

```

20133 \tl_const:Nn \c_empty_prop { \s__prop \__prop_chk:w }

```

(End of definition for `\c_empty_prop`. This variable is documented on page 228.)

`\prop_new:N`
`\prop_new:c`

Flat property lists are initialized with the value `\c_empty_prop`.

```

20134 \cs_new_protected:Npn \prop_new:N #1
20135 {
20136     \__kernel_chk_if_free_cs:N #1
20137     \cs_gset_eq:NN #1 \c_empty_prop
20138 }
20139 \cs_generate_variant:Nn \prop_new:N { c }

```

(End of definition for `\prop_new:N`. This function is documented on page 220.)

`\prop_new_linked:N`
`\prop_new_linked:c`
`__prop_new_linked:N`

The auxiliary is used in `\prop_make_linked:N`. For linked property lists, get a new prefix in `\l__prop_internal_tl`, then use it to set up the internal structure: the last token in #1 is usually a pointer to the first key, which is here the end-pointer. That end-pointer has a pointer to the previous key (usually the last key), which is the variable #1 itself that begins the doubly-linked list.

```

20140 \cs_new_protected:Npn \prop_new_linked:N #1
20141 {
20142     \__kernel_chk_if_free_cs:N #1
20143     \__prop_new_linked:N #1
20144 }
20145 \cs_new_protected:Npn \__prop_new_linked:N #1
20146 {

```

```

20147 \__prop_next_prefix:
20148 \cs_gset_nopar:Npe #1
20149 {
20150   \__prop_flatten:w
20151   \exp_not:c { \__prop ~ \l__prop_internal_tl }
20152   \s__prop { \l__prop_internal_tl }
20153   \exp_not:c { \__prop ~ \l__prop_internal_tl }
20154 }
20155 \cs_gset_nopar:cpe { \__prop ~ \l__prop_internal_tl }
20156 {
20157   \exp_not:N \use_none:n
20158   \exp_not:N #1
20159 }
20160 }
20161 \cs_generate_variant:Nn \prop_new_linked:N { c }

```

(End of definition for `\prop_new_linked:N` and `__prop_new_linked:N`. This function is documented on page 220.)

\prop_clear:N Clearing a flat property list is like declaring it anew, simply setting it equal to `\c_empty_prop`. For linked property lists we must clear all of the variables storing individual keys, which requires a loop. At each step of the loop, `__prop_clear_loop:Nw` receives `\cs_(g)set_eq:NN`, `\use_none:n`, the backwards pointer, an empty #4 (except at the end of the loop), and the key–value pair #5=#6 which we disregard. The looping auxiliary undefines the previous key’s token list (this includes the main token list, but that is fine because it is restored at the end) and calls itself after expanding the next key’s token list. The loop ends when #4 is `\use_none:nnnn`. After the loop, `__prop_clear:wNNN` correctly sets up the main variable #6 and the end-pointer #1. Importantly, this is done using `\cs_(g)set_nopar:Npe` and `\exp_not:n` because the almost-equivalent `\tl_set:Nn` would complain in debug mode about the fact that the main variable is undefined at this stage. Importantly, `__prop_clear_entries:NN` is used in the implementation of `\prop_set_eq:NN`.

```

20162 \cs_new_protected:Npn \prop_clear:N
20163 { \__prop_clear:NNN \cs_set_eq:NN \cs_set_nopar:Npe }
20164 \cs_generate_variant:Nn \prop_clear:N { c }
20165 \cs_new_protected:Npn \prop_gclear:N
20166 { \__prop_clear:NNN \cs_gset_eq:NN \cs_gset_nopar:Npe }
20167 \cs_generate_variant:Nn \prop_gclear:N { c }

\prop_set_eq:NN If both variables are accidentally the same variable (or equal flat property lists, as it
\prop_set_eq:cN turns out) we do nothing, otherwise the following code would lose all entries. If the
\prop_set_eq:Nc target variable #3 is a flat prop, either copy directly or flatten before copying. If it is a
\prop_set_eq:cc linked prop, we must clear it, then go through the entries in #4 to add them to #3.

20228     \__prop_clear_entries:NN #4 #3
20229     \exp_args:Nf \__prop_set_eq:nNnNN {#7} #1 {#2} #5 #6
20230   }

```

We have used that `f`-expanding either type of prop gives a flat prop. At this stage `__prop_set_eq:nNnNN` receives the second variable as a flat prop, the end-pointer, the prefix, the suitable `\cs_(g)set_nopar:Npe` assignment, and the first variable itself. Remove the leading `\s__prop` and `__prop_chk:w` with `\use_i:nnn`, then start the loop.

```

20231 \cs_new_protected:Npn \__prop_set_eq:nNnNN #1#2#3#4#5
20232 {
20233   \use_i:nnn
20234   {
20235     \__prop_set_eq_loop:NNnw #5 #4 {#3}
20236     \__prop_flatten:w #2 \s__prop {#3}
20237   }
20238   #1
20239   \use_none:n \__prop_pair:wn ? \s__prop
20240 }

```

The looping function receives the current pointer `#1` (initially the variable itself), the defining function `#2` and the prefix `#3`, then a partial definition `#4` (which in later stages includes the backwards pointer), followed by the current value as `\s__prop {#5}`. It seeks the next key `#7` to construct in `\l__prop_internal_tl` the next pointer `__prop <prefix> <next key>` (the argument `#6` is empty, except at the end of the loop, where it is `\use_none:n` in such a way as to delete the `<space>` and `<next key>`). Then the token list (current pointer) `#1` is set-up to contain the partial definition and current value, as well as the newly constructed next pointer. After a line responsible for correctly ending the loop with `__prop_set_eq_end:w`, we loop, setting up the next definition, which starts with `\use_none:n` and a backwards pointer to `#1` followed by the `<next key> #7` and so on.

```

20241 \cs_new_protected:Npn \__prop_set_eq_loop:NNnw
20242   #1#2#3#4 \s__prop #5#6 \__prop_pair:wn #7 \s__prop
20243 {
20244   \tl_set:Nx \l__prop_internal_tl { \exp_not:c { __prop ~ #3 #6 ~ #7 } }
20245   #2 #1 { \exp_not:n { #4 \s__prop {#5} } \exp_not:o \l__prop_internal_tl }
20246   \use_none:n #6 \__prop_set_eq_end:w
20247   \exp_after:wN \__prop_set_eq_loop:NNnw \l__prop_internal_tl #2 {#3}
20248   \use_none:n #1 \__prop_pair:wn #7 \s__prop
20249 }

```

The end-code picks up what is needed to correctly assign the last token list (the end pointer), which is simply `\use_none:n __prop_<prefix><space><keyn>`.

```

20255 }

```

(End of definition for `\prop_set_eq:NN` and others. These functions are documented on page 220.)

`\prop_make_flat:N` The only interesting case is when given a linked prop. Clear the linked property list using `__prop_clear:wNNN` with local assignments (it does not matter since we are at

the outermost group level, and `\cs_set_eq:NN` is very slightly faster than its global version. Then store the contents (expanded preventively by `\exp_args:NNf`) with an assignment `\cs_set_nopar:Npe` that does not perform `l3debug` checks.

```

```

(End of definition for `\prop_make_flat:N` and `\prop_make_flat:c __prop_make_flat:Nn`. This function is documented on page 221.)

`\prop_make_linked:N`
`\prop_make_linked:c`
`__prop_make_linked:Nn`

The only interesting case is when given a flat prop. We expand the contents for later use. Then `__prop_new_linked:N` disregards that previous value of `#1` and initializes the linked prop. We can then use an auxiliary `__prop_set_eq:wNNNN` underlying `\prop_set_eq:NN`, with the prop contents saved as `\l__prop_internal_tl`. That step is a bit unsafe, as `\l__prop_internal_tl` (really, a flat prop here) is used within `__prop_set_eq:wNNNN` itself, but it is in fact expanded early enough to be ok.

```

20274 \cs_new_protected:Npn \prop_make_linked:N #1
20275 {
20276   \int_compare:nNnTF { \tex_currentgrouplevel:D } = 0

```

(End of definition for `\l_tmpa_prop` and others. These variables are documented on page 228.)

```

\prop_concat:NNN
\prop_concat:ccc
\prop_gconcat:NNN
\prop_gconcat:ccc
__prop_concat:NNNNN
__prop_concat:nNNN

```

The basic strategy is to copy the first variable into the target, then loop through the second variable, calling `\prop_(g)put:Nnn` on each item. To avoid running the `l3debug` scope checks on each of these steps, we use the auxiliaries that underly `\prop_set_eq:NN` and `\prop_put:Nnn`, whose syntax is a bit unwieldy. We work directly with the target `prop #3` as a scratch space, because copying over from a temporary variable to `#3` would be slow in the linked case. If `#5` is `#3` itself we have to be careful not to lose the data, and we even take the opportunity to skip the copying step completely. To keep the correct version of the duplicate keys we use the code underlying `\prop_put_if_not_in:Nnn`, which involves passing `\use_none:nnn` to the auxiliary instead of nothing. There is no need to check for the case where `#3` is equal to `#4` because in that case `\prop_(g)set_eq:NN #3 #4` (or rather the underlying auxiliary) is correctly set up to do no needless work.

```

\prop_gput_from_keyval:Nn
\prop_gput_from_keyval:cn
__prop_from_keyval:nn
__prop_from_keyval:Nnn
__prop_missing_eq:n

```

The core is a call to `\keyval_parse:nnn`, with an error message `__prop_missing_eq:n` for entries without `=`, and a call to (essentially) `\prop_(g)put:Nnn` for valid key–value pairs. To avoid repeated scope checks (and errors) when `l3debug` is active, we instead use the auxiliary underlying `\prop_put:Nnn`. Because blank keys are valid here, in contrast to `l3keys`, we set and restore `\l__kernel_keyval_allow_blank_keys_bool`. The key–value argument may be quite large so we avoid reading it until it is really necessary.

```

20352 \cs_generate_variant:Nn \prop_gset_from_keyval:Nn { c }

```

(End of definition for `\prop_set_from_keyval:Nn` and `\prop_gset_from_keyval:Nn`. These functions are documented on page 221.)

`\prop_const_from_keyval:Nn`
`\prop_const_from_keyval:cn`
`\prop_const_linked_from_keyval:Nn`
`\prop_const_linked_from_keyval:cn`

For both flat and linked constant props, we create #1 then use the same auxiliary as for `\prop_gput_from_keyval:Nn`. It is most natural to use the already packaged `\prop_gput:Nnn`, but that would mean doing an assignment on a supposedly constant property list. To avoid errors when l3debug is activated, we use the auxiliary underlying `\prop_gput:Nnn`.

```

20353 \cs_new_protected:Npn \prop_const_from_keyval:Nn #1
20354 {
20355   \prop_new:N #1
20356   __prop_from_keyval:nn { __prop_put:nNNnn { } \cs_gset_nopar:Npe #1 }
20357 }
20358 \cs_generate_variant:Nn \prop_const_from_keyval:Nn { c }
20359 \cs_new_protected:Npn \prop_const_linked_from_keyval:Nn #1
20360 {

```

```

20361 \prop_new_linked:N #1
20362 \__prop_from_keyval:nn { \__prop_put:nNnn { } \cs_gset_nopar:Npe #1 }
20363 }
20364 \cs_generate_variant:Nn \prop_const_linked_from_keyval:Nn { c }

```

(End of definition for `\prop_const_from_keyval:Nn` and `\prop_const_linked_from_keyval:Nn`. These functions are documented on page 221.)

66.4 Accessing data in property lists

Accessing/deleting/adding entries is mostly done by `__prop_split:NnTFn`, which must be fast because it is used in many `l3prop` functions. Its syntax is as follows.

```

\__prop_split:NnTFn <property list> {<key>}
{<true code>} {<false code>} {<link code>}

```

If the `<property list>` uses the linked data storage, then it runs the `<link code>`, otherwise it does as follows.

It splits the `<property list>` at the `<key>`, giving three token lists: the `<entries before>` the `<key>`, the `<value>` associated with the `<key>` and the `<entries after>` the `<key>`. Both the `<entries before>` and the `<entries after>` can be empty or consist of some number of consecutive entries `__prop_pair:wn <keyi> \s__prop {<valuei>}`. If the `<key>` is present in the `<property list>` then the `<true code>` is left in the input stream, with #1, #2, and #3 replaced by the `<entries before>`, `<value>`, and `<entries after>`. If the `<key>` is not present in the `<property list>` then the `<false code>` is left in the input stream. Only the `<true code>` is used in the replacement text of a macro defined internally, which requires `##` doubling.

```

\__prop_split:NnTFn
\__prop_split_aux:nNnTFn
\__prop_split_test:wn
\__prop_split_flat:w
\__prop_split_linked:w
\__prop_split_wrong:Nw

```

The aim is to distinguish four cases: a flat prop that contains the given `<key>`, a flat prop that does not contain it, a linked prop, and an invalid prop. The last case includes those that are set to `\relax` by c-expansion, as well as unrelated token list variables since these unfortunately used to “work” in earlier implementations. In the first three cases we run the T, F, and n arguments, and in the last case we raise an error, set the variable to a known state (empty prop), and run the F code (some conditionals such as `\prop_pop:NnNTF` otherwise blow up pretty badly).

The first distinction between these cases is done by `__prop_split_test:wn`, which looks for the argument after `\s__prop`. For a flat prop it will be `__prop_chk:w`, which leads to running `__prop_split_flat:w`, explained below. For a linked prop it is the prefix, consisting of characters, so we end up running `__prop_split_linked:w`, which cleans up and selects the aforementioned n argument. For invalid props, or rather, variables that do not contain `\s__prop`, the argument includes `\fi:`, and we end up calling `__prop_split_wrong:Nw`, which calls `\prop_show:N` to raise a detailed error stating how the variable is wrong.

Let us return to `__prop_split_flat:w`. This function is defined dynamically as

```

\cs_set:Npn \__prop_split_flat:w \__prop_split_linked:w #1
\__prop_pair:wn <key> \s__prop #2
#3 \s__prop_mark #4 #5 \s__prop_stop
{ #4 {<true code>} }

```

Its job is to seek the $\langle \text{key} \rangle$ in the property list (known to be flat at this stage) by using an argument #1 delimited essentially by that key. If indeed the variable contained the $\langle \text{key} \rangle$, then #1 is the $\langle \text{extract}_1 \rangle$ before the key–value pair, #2 is the $\langle \text{value} \rangle$ associated with the $\langle \text{key} \rangle$, #3 is the $\langle \text{extract}_2 \rangle$ after the key–value pair, #4 is $\backslash \text{use_i:nnn}$, and we run $\backslash \text{use_i:nnn} \{ \langle \text{true code} \rangle \} \{ \langle \text{false code} \rangle \} \{ \langle \text{link code} \rangle \}$, selecting the $\langle \text{true code} \rangle$. Otherwise, the whole property list together with $\backslash \text{s_prop_mark} \backslash \text{use_i:nnn}$ is taken in as #1, then #2 is some tokens $? \backslash \text{fi:} \backslash \text{__prop_split_wrong:Nw} \langle \text{variable} \rangle$ that were only useful in the case of invalid props, #3 is empty, and most importantly #4 is $\backslash \text{use_ii:nnn}$. This command selects the $\langle \text{false code} \rangle$.

Note that we define $\backslash \text{__prop_split_flat:w}$ in all cases even though it is only used in the flat case. Indeed, to avoid taking in the whole property list (which may be large) as an argument more than strictly necessary, we would have to keep the $\langle \text{true code} \rangle$ positioned before the expansion of the prop variable in order to use it in the definition. The only way to do that is to store it using an assignment so we might as well just perform the assignment that we can actually use in the flat case.

(End of definition for $\backslash \text{__prop_split:NnTFn}$ and others.)

$\backslash \text{prop_get:NnN}$ Here we implement both $\backslash \text{prop_get:NnN}$ and its branching version through $\backslash \text{__prop_get:NnnTF}$. It receives the prop and key, followed by an assignment used when the value is found, $\langle \text{true code} \rangle$ to run after the assignment, and some fall-back $\langle \text{false code} \rangle$ for absent values. It relies on $\backslash \text{__prop_split:NnTFn}$. For a flat prop, the first four arguments of $\backslash \text{__prop_split:NnTFn}$ are used, and run either the assignment #3{##3} and $\langle \text{true code} \rangle$ #4, or the $\langle \text{false code} \rangle$ #5.

```

For a linked prop we must work a bit: `__prop_get_linked:w` is followed by the expansion of the prop, then by four brace groups: the key #4, the assignment code #5, `<true code>` #6, and `<false code>` #7. If the key is present, its value is stored in the token list `__prop_#2~#4`. If that token list exists, `__prop_get_linked_aux:w` gets called followed by the expansion of that token list and we grab as #2 the value associated to that key, which we feed to the assignment code and follow-up code. If the key is absent the token list can be `\undefined` or `\relax`. In both cases `__prop_get_linked_aux:w` finds an empty brace group as #2, `\use_none:n` as #4 and the `<false code>` as #5. Note that we made `__prop_get_linked:w` and subsequent auxiliaries expandable, because they are also used in `\prop_item:Nn`.

66.5 Removing data from property lists

```

\__prop_pop:NnNnTF This auxiliary is used by both the \prop_pop family and the \prop_remove family of functions. It receives a <prop> and a {<key>}, three assignment functions (\tl_set:Nn \cs_set_eq:NN \cs_set_nopar:Npe or their global versions), then {<code>} {<true code>} {<false code>}.
\__prop_pop_linked:wnNnNtf
\__prop_pop_linked:NnNn
\__prop_pop_linked:w
\__prop_pop_linked_prev:w
\__prop_pop_linked_next:w

```

For a flat prop, split it. If the `<key>` is there, reconstruct the rest of the prop from the two extracts `##2 ##4` and assign using `\tl_(g)set:Nn`, then run `<code> {<value>}` with the `<value>` found, and run the `<true code>`. If the `<key>` is absent, run the `<false code>`.

For a linked prop, the removal is done by `__prop_pop_linked:wnNnNtf`, which removes the key–value pair from the doubly-linked list and runs its last three arguments `{<code>} {<true code>} {<false code>}` depending on whether the key–value is found, in the same way as for flat props.

```

20452 \cs_new_protected:Npn \__prop_pop:NnNnTF #1#2#3#4#5#6#7
20453 {
20454 \__prop_split:NtfN #1 {#2}

20462 \exp_after:wN \__prop_pop_linked:wnNnNtf #1 {#2}
20463 #3 #4 {#5} {#6} {#7}
20464 }

```

20465 }

The next auxiliary `__prop_pop_linked:wnNNnTF`, together with the `NNNn` auxiliary, checks if the key is present in the $\langle linked\ prop \rangle$, then the corresponding value (if present) is passed as a braced argument to the $\langle code \rangle$ and the $\langle true\ code \rangle$ or $\langle false\ code \rangle$ is run as appropriate. Before that, there are also three assignments: the token lists for the previous key and next key are made to point to each other, cf. `__prop_pop_linked:w`, and the token list for the given key is made undefined.

```

66.6 Adding data to property lists

`\prop_put:Nnn` All of the `\prop_(g)put(_if_new):Nnn` functions are based on the same auxiliary, which receives `<code>` and an “assignment”, followed by `<prop> {<key>} {<new value>}`. The assignment `\cs_(g)set_nopar:Npe` is the primitive assignment without any checking: in the case of linked props it is applied to individual pieces of the linked prop, which are typically not yet defined. Debugging the scope of the variable is done at a higher level by letting `l3debug` change `\prop_put:Nnn` and friends. This allows other `l3prop` commands to directly call the underlying auxiliary to skip this checking step and avoid getting multiple error messages for the same error. The `<code>` (empty for `put` and `\use_none:nnn` for `put_if_not_in`) is placed before the assignment in cases where the key is already present, in order to suppress the assignment in the `put_if_not_in` case.

```

Since the true branch of `__prop_split:NnTFn` is used as the replacement text of an internal macro, and since the `<key>` and new `<value>` may contain arbitrary tokens, it is not safe to include them in the argument of `__prop_split:NnTFn`. We thus start by storing in `\l__prop_internal_tl` tokens which (after x-expansion) encode the key–value pair. This variable can safely be used in `__prop_split:NnTFn`. For a flat prop, if the `<key>` was absent, append the new key–value to the list; otherwise concatenate the extracts `##2` and `##4` with the new key–value pair `\l__prop_internal_tl`. The updated entry is placed at the same spot as the original `<key>` in the property list, preserving the order of entries. For a linked prop, call `__prop_put_linked:wnNN`, which constructs the control sequence in which we will place the new value. If it matches `\scan_stop:` then the key was not yet there and we add it using `__prop_put_linked_new:w`, otherwise it was already there and we use `__prop_put_linked_old:w`.

```

```

To add a new entry, `__prop_put_linked_new:w` receives the expansion of the end-pointer, namely `\use_none:n` (*last key pointer*), followed by the new key pointer #2, the end pointer #3, and an assignment function #4. Set up the doubly-linked list in the order #1, #2, #3, placing the key-value pair `\l__prop_internal_tl` in #2. To replace an old entry, `__prop_put_linked_old:w` receives the expansion of that entry, and it reassigns it (#5) using the assignment #6, by simply replacing the payload #2 `\s__prop` #3 by `\l__prop_internal_tl`.

20663   { TF , T , F , p }

```

(End of definition for `\prop_if_exist:NTF`. This function is documented on page 224.)

`\prop_if_empty_p:N` A flat property list is empty if it matches `\c_empty_prop`. A linked property list is empty if its second token (the end pointer) and last token (the first key pointer) are equal. There cannot be false positives because the end pointer takes the form `\use_none:n <pointer>` while the other pointers have more elaborate structure. The subtle code branch here is when a non-empty flat property list is given: then `__prop_if_empty:w` reads the whole property list as #1 and #2, #3, #4 are 2, 3, 4, respectively.

```

20664 \prg_new_conditional:Npnn \prop_if_empty:N #1 { p , T , F , TF }
20665 {
20666   \if_meaning:w #1 \c_empty_prop

20683 { c } { p , T , F , TF }

```

(End of definition for `\prop_if_empty:N` and `__prop_if_empty_return:w`. This function is documented on page 225.)

`\prop_if_in_p:Nn` For a linked prop, use `__prop_get_linked:w` to look up whether the control sequence constructed from the prefix and the sought-after key exists; this auxiliary calls `\use_none:n {<value>}` `\prg_return_true:` if the key is found, and otherwise `\prg_return_false:`. For a flat prop, testing expandably if a key is there requires to go through the key-value pairs one by one. This is rather slow, and a faster test would be

`\prop_if_in_p:Nv`
`\prop_if_in_p:Ne`
`\prop_if_in_p:No`
`\prop_if_in_p:cn`
`\prop_if_in_p:cV`
`\prop_if_in_p:ce`
`\prop_if_in_p:co`

66.8 Mapping over property lists

`\prop_map_function:NN` We first f-expand to flatten #1 in case it was a linked list. The `\use_i:nnn` removes the leading `\s__prop __prop_chk:w` of the flattened prop. The even-numbered arguments of `__prop_map_function:Nw` are keys, hence have string catcodes, except at the end where they are `\fi: \prop_map_break:.` The `\fi:` ends the `\if_false: #⟨even⟩ \fi:` construction and we jump out of the loop. No need for any quark test.

```

20707 \cs_new:Npn \prop_map_function:NN #1#2
20708 {
20709     \exp_last_unbraced:Nnf
20710     \use_i:nnn { \__prop_map_function:Nw #2 } #1
20711     \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20712     \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20713     \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20714     \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20715     \prg_break_point:Nn \prop_map_break: { }
20716 }
20717 \cs_new:Npn \__prop_map_function:Nw #1
20718     \__prop_pair:wn #2 \s__prop #3
20719     \__prop_pair:wn #4 \s__prop #5
20720     \__prop_pair:wn #6 \s__prop #7
20721     \__prop_pair:wn #8 \s__prop #9
20722 {
20723     \if_false: #2 \fi: #1 {#2} {#3}
20724     \if_false: #4 \fi: #1 {#4} {#5}
20725     \if_false: #6 \fi: #1 {#6} {#7}
20726     \if_false: #8 \fi: #1 {#8} {#9}
20727     \__prop_map_function:Nw #1
20728 }
20729 \cs_generate_variant:Nn \prop_map_function:NN { Nc , c , cc }

```

(End of definition for `\prop_map_function:NN` and `__prop_map_function:Nw`. This function is documented on page 226.)

\prop_map_inline:Nn Mapping in line requires a nesting level counter. Store the current definition of `__prop_pair:wn`, and define it anew. At the end of the loop, revert to the earlier definition. Note that besides pairs of the form `__prop_pair:wn <key> \s__prop {<value>}`, there are a leading and a trailing tokens, but both are equal to `\scan_stop:`, hence have no effect in such inline mapping. Such `\scan_stop:` could have affected ligatures if they appeared during the mapping.

\prop_map_inline:cn

```

20730 \cs_new_protected:Npn \prop_map_inline:Nn #1#2
20731 {
20732   \cs_gset_eq:cn
20733   { __prop_map_ \int_use:N \g__kernel_prg_map_int :wn } \__prop_pair:wn
20734   \int_gincr:N \g__kernel_prg_map_int
20735   \cs_gset_protected:Npn \__prop_pair:wn ##1 \s__prop ##2 {#2}
20736   \exp_last_unbraced:Nf \use_none:nn #1
20737   \prg_break_point:Nn \prop_map_break:
20738   {
20739     \int_gdecr:N \g__kernel_prg_map_int
20740     \cs_gset_eq:Nc \__prop_pair:wn
20741     { __prop_map_ \int_use:N \g__kernel_prg_map_int :wn }
20742   }
20743 }
20744 \cs_generate_variant:Nn \prop_map_inline:Nn { c }

```

(End of definition for `\prop_map_inline:Nn`. This function is documented on page 226.)

\prop_map_tokens:Nn The mapping is very similar to `\prop_map_function:NN`. The odd construction `\use:n {#1}` allows #1 to contain any token without interfering with `\prop_map_break:.`

\prop_map_tokens:cn The loop stops when the `<key>` between `__prop_pair:wn` and `\s__prop` is `\fi: \prop_map_break:` instead of being a string.

__prop_map_tokens:nw

```

20745 \cs_new:Npn \prop_map_tokens:Nn #1#2
20746 {
20747   \exp_last_unbraced:Nnf
20748   \use_i:nnn { \__prop_map_tokens:nw {#2} } #1
20749   \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20750   \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20751   \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20752   \__prop_pair:wn \fi: \prop_map_break: \s__prop { }
20753   \prg_break_point:Nn \prop_map_break: { }
20754 }
20755 \cs_new:Npn \__prop_map_tokens:nw #1
20756   \__prop_pair:wn #2 \s__prop #3
20757   \__prop_pair:wn #4 \s__prop #5
20758   \__prop_pair:wn #6 \s__prop #7
20759   \__prop_pair:wn #8 \s__prop #9
20760   {
20761     \if_false: #2 \fi: \use:n {#1} {#2} {#3}
20762     \if_false: #4 \fi: \use:n {#1} {#4} {#5}
20763     \if_false: #6 \fi: \use:n {#1} {#6} {#7}
20764     \if_false: #8 \fi: \use:n {#1} {#8} {#9}
20765     \__prop_map_tokens:nw {#1}
20766   }
20767 \cs_generate_variant:Nn \prop_map_tokens:Nn { c }

```

(End of definition for `\prop_map_tokens:Nn` and `__prop_map_tokens:nw`. This function is documented on page 226.)

`\prop_map_break:` The break statements are based on the general `\prg_map_break:Nn`.

`\prop_map_break:n`

```

20768 \cs_new:Npn \prop_map_break:
20769 { \prg_map_break:Nn \prop_map_break: { } }
20770 \cs_new:Npn \prop_map_break:n
20771 { \prg_map_break:Nn \prop_map_break: }

```

(End of definition for `\prop_map_break:` and `\prop_map_break:n`. These functions are documented on page 227.)

66.9 Uses of mapping over property lists

`\prop_count:N` Counting the key–value pairs in a property list is done using the same approach as for
`\prop_count:c` other count functions: turn each entry into a +1 then use integer evaluation to actually
`__prop_count:nn` do the mathematics.

```

20772 \cs_new:Npn \prop_count:N #1
20773 {
20774   \int_eval:n
20775   {
20776     0
20777     \prop_map_function:NN #1 \__prop_count:nn
20778   }
20779 }
20780 \cs_new:Npn \__prop_count:nn #1#2 { + 1 }
20781 \cs_generate_variant:Nn \prop_count:N { c }

```

(End of definition for `\prop_count:N` and `__prop_count:nn`. This function is documented on page 224.)

`\prop_to_keyval:N` Each property name and value pair will be returned in the form `_{}{<name>}=_{}{<value>}`.
`__prop_to_keyval_exp_after:wN` As one of the main use cases for this macro is to pass the `<property list>` on to a
`__prop_to_keyval:nn` key–value parser, we have to make sure that the behaviour is as good as possible. Using
`__prop_to_keyval:nnw` a space before the opening brace we get the correct brace stripping behaviour for most of
the key–value parsers available in L^AT_EX. Iterate over the `<property list>` and remove
the leading comma afterwards. Only the value has to be protected in `__kernel_`
`\exp_not:w` as the property name is always a string. After the loop the leading comma
is removed by `\use_none:n` and afterwards `__kernel_exp_not:w` eventually finds the
opening brace of its argument.

```

20782 \cs_new:Npn \prop_to_keyval:N #1
20783 {
20784   \__kernel_exp_not:w
20785   \prop_if_empty:NTF #1
20786   { {} }
20787   {
20788     \exp_after:wN \exp_after:wN \exp_after:wN
20789     {
20790       \tex_expanded:D
20791       {
20792         \exp_not:N \use_none:n
20793         \prop_map_function:NN #1 \__prop_to_keyval:nn
20794       }
20795     }
20796   }
20797 }

```

```

20798 \cs_new:Npn \__prop_to_keyval:nn #1#2
20799 { , ~ {#1} =~ { \__kernel_exp_not:w {#2} } }

```

(End of definition for `\prop_to_keyval:N` and others. This function is documented on page [224](#).)

```

```

\__prop_show_flat:w

```

```

\__prop_show_linked:w

```

Experience shows one source of problems is very hard to debug: when a data structure such as a `seq` or `prop` gets corrupted. In the past, `\prop_show:N` would in some cases happily show items of such a `prop`, even though other more demanding `!3prop` functions would choke. It is thus best to make `\prop_show:N` check very thoroughly the structure and flag issues, even though that is very painful for linked props. Throughout the code below, we strive to remain as safe as possible, but in the explanations we only state what the arguments are when the prop is correctly formed, rather than saying at every step that various arguments can be arbitrary junk, made safe by using `\tl_to_str:n` generously.

The general `__kernel_chk_tl_type:NnnT` checks that its first argument is a token list, and if it is, then it `e`-expands its second argument and compares with the contents of its first argument. Thus, within this `e`-expansion it is safe to use `__prop_if_flat:NTF` to check if the prop is flat or linked. In the flat case we simply reconstruct the expected structure using `__prop_show_flat:w`, which loops through the prop and correctly turns all keys to strings for instance. In the linked case, we use `__prop_show_linked:w`, which ensures the form `__prop_flatten:w __prop {<prefix> \s__prop {<prefix>} <rest>}`, where `<prefix>` is made into a string and `<rest>` cannot be a brace group or multiple tokens since `__prop_show_linked:w` would in such cases give a different result from the original token list.

```

20820     { \__prop_show_finally:NNn #1 #2 { flat } }
20821     {
20822       \tl_set:Nn \l__prop_internal_tl { #1 #2 }
20823       \exp_after:wN \__prop_show_prepare:w #2 #2
20824     }
20825   }

```

```

20826 }
20827 \cs_new:Npn \__prop_show_flat:w #1 \__prop_pair:wn #2 \s__prop #3
20828 {
20829   \__prop_if_recursion_tail_stop:n {#2}
20830   \exp_not:N \__prop_pair:wn \tl_to_str:n {#2} \s__prop \exp_not:n { {#3} }
20831   \__prop_show_flat:w
20832 }
20833 \cs_new:Npn \__prop_show_linked:w #1 \s__prop #2#3#4 \s__prop_stop
20834 {
20835   \exp_not:N \__prop_flatten:w
20836   \exp_not:c { __prop ~ \tl_to_str:n {#2} }
20837   \s__prop { \tl_to_str:n {#2} }
20838   \exp_not:n {#3}
20839 }

```

For flat props we are done by using `\msg_show:nneeee` or `\msg_log:nneeee`. The auxiliary `__prop_show_finally:NNn` is eventually also used in the linked case after some more tests. To avoid having to bring along the message function and the property list, we store them into `\l__prop_internal_tl`.

```

20840 \cs_new_protected:Npn \__prop_show_finally:NNn #1#2#3
20841 {
20842   #1 { prop } { show }
20843   { \token_to_str:N #2 }
20844   { \prop_map_function:NN #2 \msg_show_item:nn }
20845   {#3} { }
20846 }

```

For linked props, we now know they have a reasonable form so that we are calling `__prop_show_prepare:w __prop_flatten:w __prop <prefix> \s__prop {<prefix>} <token> <property list>`, and the task is to loop through the linked list and check integrity. We first set things up: the auxiliary `__prop_tmp:w` will be in charge of checking that various tokens start with `__prop <prefix>` (in the sense of string representations), and calling one of `__prop_show_loop_key:wNNN`, `__prop_show_end:NNN`, `__prop_show_bad_name:NNN`.

```

20847 \cs_new_protected:Npn \__prop_show_prepare:w
20848   \__prop_flatten:w #1 \s__prop #2#3#4
20849 {
20850   \use:e
20851   {
20852     \cs_set_nopar:Npn \exp_not:N \__prop_tmp:w
20853       ##1 \token_to_str:N #1 ##2 \s__prop_mark ##3 \s__prop_stop
20854     {
20855       \exp_not:N \tl_if_empty:nTF {##1}
20856       {
20857         \exp_not:N \tl_if_head_is_space:nTF {##2}
20858         { \exp_not:N \exp_args:Nf \__prop_show_loop_key:wNNN }
20859         { \exp_not:N \tl_if_empty:nTF }
20860         {##2}
20861       }
20862       { \exp_not:N \use_ii:nn }
20863       \__prop_show_end:NNN
20864       \__prop_show_bad_name:NNN
20865     }
20866   }

```

```

20867 \exp_last_unbraced:NNNo \__prop_show_loop:NNw #1 #4 #4
20868 }

```

The loop will consist of calls to `__prop_show_loop:NNw __prop <prefix> <token> <expansion>`, where `<token>` is one of the items in the list, specifically the key container for `<keyi-1>` (starting at $i = 1$ with the property list variable itself), and `<expansion>` stands for the expansion of that token, which has already been checked, and takes the form `<junk> \s__prop {<value>} __prop <prefix> <keyi>`. Thus, the loop auxiliary receives the prefix command as #1, and the $(i - 1)$ -th and i -th key containers as #2 and #5. Then `__prop_tmp:w` checks that the name of the i -th key container is valid.

```

20869 \cs_new_protected:Npn \__prop_show_loop:NNw #1#2 #3 \s__prop #4#5
20870 {
20871   \exp_last_two_unbraced:Noo \__prop_tmp:w
20872   { \token_to_str:N #5 \s__prop_mark }
20873   { \token_to_str:N #1 \s__prop_mark \s__prop_stop }
20874   #1 #2 #5
20875 }

```

If the i -th key container has the wrong name we get `__prop_show_bad_name:NNN __prop <prefix> <previous container> <current container with bad name>`.

```

20876 \cs_new_protected:Npn \__prop_show_bad_name:NNN #1#2#3
20877 {
20878   \msg_error:nneeee { prop } { bad-link }
20879   { \tl_tail:N \l__prop_internal_tl }
20880   { \token_to_str:N #2 }
20881   { \token_to_str:N #3 }
20882   { \token_to_str:N #1 }
20883 }

```

If the i -th key container has the name `__prop <prefix>` (without space), it is the trailing one. We check that it is the right kind of macro to be a token list, and that it has the right contents `\use_none:n <previous container>`. If so, we are done checking everything, and we display the property list using the message function and property list name stored in `\l__prop_internal_tl`. Note that we also use this `\l__prop_internal_tl` in the type argument of `__kernel_chk_tl_type:NnnT`, to build up the name “`<property list> prop entry`” used in error messages.

```

20884 \cs_new_protected:Npn \__prop_show_end:NNN #1#2#3
20885 {
20886   \__kernel_chk_tl_type:NnnT #3
20887   { \tl_tail:N \l__prop_internal_tl prop~entry }
20888   { \exp_not:n { \use_none:n #2 } }
20889   {
20890     \exp_after:wN \__prop_show_finally:NNn
20891     \l__prop_internal_tl { linked }
20892   }
20893 }

```

If the i -th container has a name `__prop <prefix> <key>` (with a space before the key), then we have a call to `__prop_show_loop_key:wNNN {<key>} <junk12. (with an f-expansion to eliminate the space). The first argument is the <key> without a leading space, thanks to a judicious f-expansion earlier on. We check that the <current container> is a token list with the expected structure \use_none:n <previous container> __prop_pair:wn <string> \s__prop {<anything>} <single token>. The auxiliary __prop_show_flat:w`

is reused to produce the `__prop_pair:wn` part, and the last token is produced by `\tl_item:Nn` (we don't waste a specialized auxiliary to speed that up). If the check succeed, move on to the next item.

```

20894 \cs_new_protected:Npn \__prop_show_loop_key:wNNN #1#2#3#4#5#6
20895 {
20896   \__kernel_chk_tl_type:NnnT #6
20897   { \tl_tail:N \l__prop_internal_tl prop~entry }
20898   {
20899     \exp_not:n { \use_none:n #5 }
20900     \exp_after:wN \__prop_show_flat:w #6 \s__prop { }
20901     \__prop_pair:wn \q__prop_recursion_tail \s__prop { }

(End of definition for \if_dim:w, \__dim_eval:w, and \__dim_eval_end:. This function is documented
on page 244.)
```

67.2 Internal auxiliaries

```

\s__dim_mark Internal scan marks.
\s__dim_stop 20913 \scan_new:N \s__dim_mark
              20914 \scan_new:N \s__dim_stop

(End of definition for \s__dim_mark and \s__dim_stop.)

\_dim_use_none_delimit_by_s_stop:w Functions to gobble up to a scan mark.
20915 \cs_new:Npn \_dim_use_none_delimit_by_s_stop:w #1 \s__dim_stop { }

(End of definition for \_dim_use_none_delimit_by_s_stop:w.)
```

67.3 Creating and initialising dim variables

```

\dim_new:N Allocating ⟨dim⟩ registers ...
\dim_new:c 20916 \cs_new_protected:Npn \dim_new:N #1
           20917 {
           20918   \__kernel_chk_if_free_cs:N #1
           20919   \cs:w newdimen \cs_end: #1
           20920 }
           20921 \cs_generate_variant:Nn \dim_new:N { c }
```

(End of definition for `\dim_new:N`. This function is documented on page 229.)

`\dim_const:Nn` Contrarily to integer constants, we cannot avoid using a register, even for constants. We cannot use `\dim_gset:Nn` because debugging code would complain that the constant is not a global variable. Since `\dim_const:Nn` does not need to be fast, use `\dim_eval:n` to avoid needing a debugging patch that wraps the expression in checking code.

`\dim_const:cn`

```
20922 \cs_new_protected:Npn \dim_const:Nn #1#2
20923 {
20924   \dim_new:N #1
20925   \tex_global:D #1 = \dim_eval:n {#2} \scan_stop:
20926 }
20927 \cs_generate_variant:Nn \dim_const:Nn { c }
```

(End of definition for `\dim_const:Nn`. This function is documented on page 229.)

`\dim_zero:N` Reset the register to zero. Using `\c_zero_skip` deals with the case where the variable passed is incorrectly a skip (for example a L^AT_EX 2_ε length). Besides, these functions are then simply copied for `\skip_zero:N` and related functions.

`\dim_zero:c`

`\dim_gzero:N`

`\dim_gzero:c`

```
20928 \cs_new_protected:Npn \dim_zero:N #1 { #1 = \c_zero_skip }
20929 \cs_new_protected:Npn \dim_gzero:N #1
20930 { \tex_global:D #1 = \c_zero_skip }
20931 \cs_generate_variant:Nn \dim_zero:N { c }
20932 \cs_generate_variant:Nn \dim_gzero:N { c }
```

(End of definition for `\dim_zero:N` and `\dim_gzero:N`. These functions are documented on page 229.)

`\dim_zero_new:N` Create a register if needed, otherwise clear it.

`\dim_zero_new:c`

`\dim_gzero_new:N`

`\dim_gzero_new:c`

```
20933 \cs_new_protected:Npn \dim_zero_new:N #1
20934 { \dim_if_exist:NTF #1 { \dim_zero:N #1 } { \dim_new:N #1 } }
20935 \cs_new_protected:Npn \dim_gzero_new:N #1
20936 { \dim_if_exist:NTF #1 { \dim_gzero:N #1 } { \dim_new:N #1 } }
20937 \cs_generate_variant:Nn \dim_zero_new:N { c }
20938 \cs_generate_variant:Nn \dim_gzero_new:N { c }
```

(End of definition for `\dim_zero_new:N` and `\dim_gzero_new:N`. These functions are documented on page 229.)

`\dim_if_exist_p:N` Copies of the cs functions defined in l3basics.

`\dim_if_exist_p:c`

`\dim_if_exist:NTF`

`\dim_if_exist:cTF`

```
20939 \prg_new_eq_conditional:NNn \dim_if_exist:N \cs_if_exist:N
20940 { TF , T , F , p }
20941 \prg_new_eq_conditional:NNn \dim_if_exist:c \cs_if_exist:c
20942 { TF , T , F , p }
```

(End of definition for `\dim_if_exist:NTF`. This function is documented on page 230.)

67.4 Setting dim variables

`\dim_set:Nn` Setting dimensions is easy enough but when debugging we want both to check that the variable is correctly local/global and to wrap the expression in some code. The `\scan_stop:` deals with the case where the variable passed is a skip (for example a L^AT_EX 2_ε length).

`\dim_set:cn`

`\dim_set:NV`

`\dim_set:cV`

`\dim_gset:Nn`

`\dim_gset:cn`

`\dim_gset:NV`

`\dim_gset:cV`

```
20943 \cs_new_protected:Npn \dim_set:Nn #1#2
20944 { #1 = \__dim_eval:w #2 \__dim_eval_end: \scan_stop: }
```

```

20945 \cs_new_protected:Npn \dim_gset:Nn #1#2
20946 { \tex_global:D #1 = \__dim_eval:w #2 \__dim_eval_end: \scan_stop: }
20947 \cs_generate_variant:Nn \dim_set:Nn { NV , c , cV }
20948 \cs_generate_variant:Nn \dim_gset:Nn { NV , c , cV }

```

(End of definition for `\dim_set:Nn` and `\dim_gset:Nn`. These functions are documented on page 230.)

`\dim_set_eq:NN` All straightforward, with a `\scan_stop:` to deal with the case where #1 is (incorrectly) a skip.

```

\dim_set_eq:cn
\dim_set_eq:Nc
\dim_set_eq:cc
20949 \cs_new_protected:Npn \dim_set_eq:NN #1#2
20950 { #1 = #2 \scan_stop: }
\dim_gset_eq:NN
20951 \cs_generate_variant:Nn \dim_set_eq:NN { c , Nc , cc }
\dim_gset_eq:cn
20952 \cs_new_protected:Npn \dim_gset_eq:NN #1#2
\dim_gset_eq:Nc
20953 { \tex_global:D #1 = #2 \scan_stop: }
\dim_gset_eq:cc
20954 \cs_generate_variant:Nn \dim_gset_eq:NN { c , Nc , cc }

```

(End of definition for `\dim_set_eq:NN` and `\dim_gset_eq:NN`. These functions are documented on page 230.)

`\dim_add:Nn` Using by here would slow things down just to detect nonsensical cases such as passing `\dimen 123` as the first argument. Using `\scan_stop:` deals with skip variables. Since debugging checks that the variable is correctly local/global, the global versions cannot be defined as `\tex_global:D` followed by the local versions.

```

\dim_add:cn
\dim_gadd:Nn
20955 \cs_new_protected:Npn \dim_add:Nn #1#2
20956 { \tex_advance:D #1 \__dim_eval:w #2 \__dim_eval_end: \scan_stop: }
\dim_sub:cn
20957 \cs_new_protected:Npn \dim_gadd:Nn #1#2
\dim_gsub:cn
20958 {
20959   \tex_global:D \tex_advance:D #1
20960   \__dim_eval:w #2 \__dim_eval_end: \scan_stop:
20961 }
20962 \cs_generate_variant:Nn \dim_add:Nn { c }
20963 \cs_generate_variant:Nn \dim_gadd:Nn { c }
20964 \cs_new_protected:Npn \dim_sub:Nn #1#2
20965 { \tex_advance:D #1 - \__dim_eval:w #2 \__dim_eval_end: \scan_stop: }
20966 \cs_new_protected:Npn \dim_gsub:Nn #1#2
20967 {
20968   \tex_global:D \tex_advance:D #1
20969   -\__dim_eval:w #2 \__dim_eval_end: \scan_stop:
20970 }
20971 \cs_generate_variant:Nn \dim_sub:Nn { c }
20972 \cs_generate_variant:Nn \dim_gsub:Nn { c }

```

(End of definition for `\dim_add:Nn` and others. These functions are documented on page 230.)

67.5 Utilities for dimension calculations

`__dim_sep:`

```

20973 \cs_new_eq:NN \__dim_sep: \__kernel_int_sep:

```

(End of definition for `__dim_sep:.`)

\dim_abs:n Functions for min, max, and absolute value with only one evaluation. The absolute value is evaluated by removing a leading - if present.

__dim_abs:N

\dim_max:nn

\dim_min:nn

__dim_maxmin:wwN

```

20974 \cs_new:Npn \dim_abs:n #1
20975 {
20976   \exp_after:wN \__dim_abs:N
20977   \dim_use:N \__dim_eval:w #1 \__dim_eval_end:
20978 }
20979 \cs_new:Npn \__dim_abs:N #1
20980 { \if_meaning:w - #1 \else: \exp_after:wN #1 \fi: }
20981 \cs_new:Npn \dim_max:nn #1#2
20982 {
20983   \dim_use:N \__dim_eval:w \exp_after:wN \__dim_maxmin:wwN
20984   \dim_use:N \__dim_eval:w #1 \exp_after:wN \__dim_sep:
20985   \dim_use:N \__dim_eval:w #2 \__dim_sep:
20986   >
20987   \__dim_eval_end:
20988 }
20989 \cs_new:Npn \dim_min:nn #1#2
20990 {
20991   \dim_use:N \__dim_eval:w \exp_after:wN \__dim_maxmin:wwN
20992   \dim_use:N \__dim_eval:w #1 \exp_after:wN \__dim_sep:
20993   \dim_use:N \__dim_eval:w #2 \__dim_sep:
20994   <
20995   \__dim_eval_end:
20996 }
20997 \cs_new:Npn \__dim_maxmin:wwN #1 \__dim_sep: #2 \__dim_sep: #3
20998 {
20999   \if_dim:w #1 #3 #2 ~
21000   #1
21001   \else:
21002   #2
21003   \fi:
21004 }

```

(End of definition for \dim_abs:n and others. These functions are documented on page 230.)

\dim_ratio:nn With dimension expressions, something like 10 pt * (5 pt / 10 pt) does not work. Instead, the ratio part needs to be converted to an integer expression. Using \int_value:w forces everything into sp, avoiding any decimal parts.

__dim_ratio:n

```

21005 \cs_new:Npn \dim_ratio:nn #1#2
21006 { \__dim_ratio:n {#1} / \__dim_ratio:n {#2} }
21007 \cs_new:Npn \__dim_ratio:n #1
21008 { \int_value:w \__dim_eval:w (#1) \__dim_eval_end: }

```

(End of definition for \dim_ratio:nn and __dim_ratio:n. This function is documented on page 231.)

67.6 Dimension expression conditionals

\dim_compare_p:nNn Simple comparison.

\dim_compare:nNnTF

```

21009 \prg_new_conditional:Npnn \dim_compare:nNn #1#2#3 { p , T , F , TF }
21010 {
21011   \if_dim:w \__dim_eval:w #1 #2 \__dim_eval:w #3 \__dim_eval_end:
21012   \prg_return_true: \else: \prg_return_false: \fi:
21013 }

```

(End of definition for `\dim_compare:nNnTF`. This function is documented on page 231.)

```

\dim_compare_p:n This code is adapted from the \int_compare:nTF function. First make sure that there
\dim_compare:nTF is at least one relation operator, by evaluating a dimension expression with a trail-
  \__dim_compare:w ing \__dim_compare_error:. Just like for integers, the looping auxiliary \__dim_
\__dim_compare:wNn compare:wNn closes a primitive conditional and opens a new one. It is actually easier to
\__dim_compare_=:w grab a dimension operand than an integer one, because once evaluated, dimensions all
\__dim_compare_!:w end with pt (with category other). Thus we do not need specific auxiliaries for the three
\__dim_compare_<:w “simple” relations <, =, and >.
\__dim_compare_>:w
\__dim_compare_error:
21014 \prg_new_conditional:Npnn \dim_compare:n #1 { p , T , F , TF }
21015 {

67.8 Dimension step functions

`\dim_step_function:nnnN` Before all else, evaluate the initial value, step, and final value. Repeating a function by steps first needs a check on the direction of the steps. After that, do the function for the start value then step and loop around. It would be more symmetrical to test for a step

size of zero before checking the sign, but we optimize for the most frequent case (positive step).

```

21140 \cs_new:Npn \dim_step_function:nnnN #1#2#3
21141 {
21142   \exp_after:wN \__dim_step:wwwN
21143   \tex_the:D \__dim_eval:w #1 \exp_after:wN \__dim_sep:
21144   \tex_the:D \__dim_eval:w #2 \exp_after:wN \__dim_sep:
21145   \tex_the:D \__dim_eval:w #3 \__dim_sep:
21146 }
21147 \cs_new:Npn \__dim_step:wwwN #1 \__dim_sep: #2 \__dim_sep: #3 \__dim_sep: #4

21167     #1 { \dim_eval:n { #2 + #3 } } {#3} {#4} #5
21168   }
21169 }

```

(End of definition for `\dim_step_function:nnnN`, `__dim_step:wwwN`, and `__dim_step:NnnnN`. This function is documented on page 234.)

`\dim_step_inline:nnnn`
`\dim_step_variable:nnnNn`
`__dim_step:NNnnnn`

The approach here is to build a function, with a global integer required to make the nesting safe (as seen in other in line functions), and map that function using `\dim_step_function:nnnN`. We put a `\prg_break_point:Nn` so that `map_break` functions from other modules correctly decrement `\g__kernel_prg_map_int` before looking for their own break point. The first argument is `\scan_stop:`, so that no breaking function recognizes this break point as its own.

```

21170 \cs_new_protected:Npn \dim_step_inline:nnnn
21171 {
21172   \int_gincr:N \g__kernel_prg_map_int
21173   \exp_args:NNc \__dim_step:NNnnnn
21174   \cs_gset_protected:Npn
21175   { \__dim_map_ \int_use:N \g__kernel_prg_map_int :w }
21176 }
21177 \cs_new_protected:Npn \dim_step_variable:nnnNn #1#2#3#4#5
21178 {
21179   \int_gincr:N \g__kernel_prg_map_int
21180   \exp_args:NNc \__dim_step:NNnnnn
21181   \cs_gset_protected:Npe

```

```

21182     { __dim_map_ \int_use:N \g__kernel_prg_map_int :w }
21183     {#1}{#2}{#3}
21184     {
21185         \tl_set:Nn \exp_not:N #4 {##1}
21186         \exp_not:n {#5}
21187     }
21188 }
21189 \cs_new_protected:Npn \__dim_step:NNnnnn #1#2#3#4#5#6
21190 {
21191     #1 #2 ##1 {#6}
21192     \dim_step_function:nnnN {#3} {#4} {#5} #2
21193     \prg_break_point:Nn \scan_stop: { \int_gdecr:N \g__kernel_prg_map_int }
21194 }

```

(End of definition for `\dim_step_inline:nnnn`, `\dim_step_variable:nnnN`, and `__dim_step:NNnnnn`. These functions are documented on page 235.)

67.9 Using dim expressions and variables

`\dim_eval:n` Evaluating a dimension expression expandably.

```

21195 \cs_new:Npn \dim_eval:n #1
21196 { \dim_use:N \__dim_eval:w #1 \__dim_eval_end: }

```

(End of definition for `\dim_eval:n`. This function is documented on page 235.)

`\dim_sign:n` See `\dim_abs:n`. Contrarily to `\int_sign:n` the case of a zero dimension cannot be distinguished from a positive dimension by looking only at the first character, since `0.2pt` and `0pt` start the same way. We need explicit comparisons. We start by distinguishing the most common case of a positive dimension.

`__dim_sign:Nw`

```

21197 \cs_new:Npn \dim_sign:n #1
21198 {
21199     \int_value:w \exp_after:wN \__dim_sign:Nw
21200     \dim_use:N \__dim_eval:w #1 \__dim_eval_end: \__dim_sep:
21201     \exp_stop_f:
21202 }
21203 \cs_new:Npn \__dim_sign:Nw #1#2 \__dim_sep:
21204 {
21205     \if_dim:w #1#2 > \c_zero_dim
21206     1
21207     \else:
21208         \if_meaning:w - #1
21209         -1
21210         \else:
21211         0
21212         \fi:
21213     \fi:
21214 }

```

(End of definition for `\dim_sign:n` and `__dim_sign:Nw`. This function is documented on page 235.)

`\dim_use:N` Accessing a $\langle dim \rangle$. We hand-code the `c` variant for some speed gain.

`\dim_use:c`

```

21215 \cs_new_eq:NN \dim_use:N \tex_the:D
21216 \cs_new:Npn \dim_use:c #1 { \tex_the:D \cs:w #1 \cs_end: }

```

(End of definition for `\dim_use:N`. This function is documented on page 235.)

`\dim_to_decimal:n` A function which comes up often enough to deserve a place in the kernel. Evaluate the dimension expression `#1` then remove the trailing `pt`. When debugging is enabled, the argument is put in parentheses as this prevents the dimension expression from terminating early and leaving extra tokens lying around. This is used a lot by low-level manipulations.

`_dim_to_decimal:w`

```

21217 \cs_new:Npn \dim_to_decimal:n #1
21218 {
21219   \exp_after:wN
21220   \_dim_to_decimal:w \dim_use:N \_dim_eval:w #1 \_dim_eval_end:
21221 }
21222 \use:e
21223 {
21224   \cs_new:Npn \exp_not:N \_dim_to_decimal:w
21225   #1 . #2 \tl_to_str:n { pt }
21226 }
21227 {
21228   \int_compare:nNnTF {#2} > \c_zero_int
21229   { #1 . #2 }
21230   { #1 }
21231 }

```

(End of definition for `\dim_to_decimal:n` and `_dim_to_decimal:w`. This function is documented on page 235.)

`\dim_to_fp:n` Defined in `l3fp-convert`, documented here.

(End of definition for `\dim_to_fp:n`. This function is documented on page 237.)

67.10 Conversion of `dim` to other units

The conversion from `pt` or `sp` to other units is complicated by the fact that `TeX`'s conversion to `sp` involves rounding and hard-coded ratios. In order to give re-entrant outcomes, we therefore need to do quite a bit of work: see <https://github.com/latex3/latex3/issues/954> for detailed discussion. After dealing with the trivial case, we therefore have some work to do. The code to do this is contributed by Ruixi Zhang.

`\dim_to_decimal_in_sp:n` The one easy case: the only requirement here is that we avoid an overflow.

```

21232 \cs_new:Npn \dim_to_decimal_in_sp:n #1
21233 { \int_value:w \_dim_eval:w #1 \_dim_eval_end: }

```

(End of definition for `\dim_to_decimal_in_sp:n`. This function is documented on page 237.)

`\dim_to_decimal_in_bp:n` We first set up a helper macro `_dim_tmp:w` which takes two arguments. The first argument is one of the following engine-defined units: `in`, `pc`, `cm`, `mm`, `bp`, `dd`, `cc`, `nd`, and `nc`. The second argument is $\frac{1}{2}\delta^{-1}$ in reduced fraction, where $\delta > 1$ is the engine-defined conversion factor for each unit. Note that δ must be strictly larger than 1 for the following algorithm to work.

`\dim_to_decimal_in_cc:n`
`\dim_to_decimal_in_cm:n`
`\dim_to_decimal_in_dd:n`
`\dim_to_decimal_in_in:n`
`\dim_to_decimal_in_mm:n`
`\dim_to_decimal_in_pc:n`
`_dim_to_decimal_aux:w`

Here is how the algorithm works: Suppose that a user inputs a non-negative dimension in a unit that has conversion factor $\delta > 1$. Then this dimension is internally represented as X `sp`, where $X = \lfloor N\delta \rfloor$ for some integer $N \geq 0$. We then seek a formula to express this N using X . The `\dim_to_decimal_in_<unit>:n` functions shall return

the number $N/2^{16}$ in decimal. This way, we guarantee the returned decimal followed by the original unit will parse to exactly X sp.

So how do we get N from X ? Well, since $X = \lfloor N\delta \rfloor$, we have $X \leq N\delta < X+1$ and $X\delta^{-1} \leq N < (X+1)\delta^{-1}$. Let's focus on the midpoint of this bounding interval for N . The midpoint is $(X + \frac{1}{2})\delta^{-1}$. The fact $\delta > 1$ implies that the bounding interval is shorter than 1 in length. Thus, (1) midpoint + $\frac{1}{2} > N$ and (2) midpoint + $\frac{1}{2} < N+1$. In other words, $N = \lfloor \text{midpoint} + \frac{1}{2} \rfloor$. As long as we can rewrite the midpoint as the result of a “scaling operation” of $\varepsilon\text{-TeX}$, the $\lfloor \dots + \frac{1}{2} \rfloor$ part will follow naturally. Indeed we can: midpoint = $(2X+1) \times (\frac{1}{2}\delta^{-1})$.

Addendum: If $\delta \geq 2$, then the bounding interval for N is at most $\frac{1}{2}$ wide in length. In this case, the leftpoint $X\delta^{-1}$ suffices as $N = \lfloor X\delta^{-1} + \frac{1}{2} \rfloor$. Six out of the nine units listed above can be handled in this way, which is much simpler than using midpoint. But three remaining units have $1 < \delta < 2$; they are **bp** ($\delta = 7227/7200$), **nd** ($\delta = 685/642$), and **dd** ($\delta = 1238/1157$), and these three must be handled using midpoint. For consistency, we shall use the midpoint approach for all nine units.

```

21234 \group_begin:
21235   \cs_set_protected:Npn \__dim_tmp:w #1#2
21236     {
21237       \cs_new:cpn { dim_to_decimal_in_ #1 :n } ##1
21238         {
21239           \exp_after:wN \__dim_to_decimal_aux:w
21240             \int_value:w \__dim_eval:w ##1 \__dim_eval_end: \__dim_sep: #2 \__dim_sep:
21241         }
21242     }

```

Conversions to other units are now coded. Consult the pdf_{TeX} source for each conversion factor δ . Each factor $\frac{1}{2}\delta^{-1}$ is hand-coded for accuracy (and speed). As the units **nc** and **nd** are not supported by X_YTeX or (u)pTeX, they are not included here.

```

21243   \__dim_tmp:w { in } { 50 / 7227 } % delta = 7227/100
21244   \__dim_tmp:w { pc } { 1 / 24 } % delta = 12/1
21245   \__dim_tmp:w { cm } { 127 / 7227 } % delta = 7227/254
21246   \__dim_tmp:w { mm } { 1270 / 7227 } % delta = 7227/2540
21247   \__dim_tmp:w { bp } { 400 / 803 } % delta = 7227/7200
21248   \__dim_tmp:w { dd } { 1157 / 2476 } % delta = 1238/1157
21249   \__dim_tmp:w { cc } { 1157 / 29712 } % delta = 14856/1157
21250 \group_end:

```

The tokens after `__dim_to_decimal_aux:w` shall have the following form: `<number>__dim_sep:<half of delta inverse>__dim_sep:`, where `<number>` represents the input dimension in **sp** unit. If `<number>` is positive, then `#1` is its leading digit and `#2` (possibly empty) is all the remaining digits; If `<number>` is zero, then `#1` is `012` and `#2` is empty; If `<number>` is negative, then `#1` is its sign `-12` and `#2` is all its digits. In all three cases, `#1#2` is the original `<number>`. We can use `#1` to decide whether to use the `-1` formula or the `+1` formula.

```

21251 \cs_new:Npn \__dim_to_decimal_aux:w #1#2 \__dim_sep: #3 \__dim_sep:
21252   {
21253     \dim_to_decimal:n
21254     {

```

We need different formulae depending on whether the user input dimension is negative or not. For negative dimension (internally represented as X sp), the formula is $(2X-1) \times (\frac{1}{2}\delta^{-1})$. For non-negative dimension, the formula is $(2X+1) \times (\frac{1}{2}\delta^{-1})$. The intermediate step doubles the dimension X . To avoid overflow, we must invoke `\int_eval:n`.

```

21255 \int_eval:n
21256 { ( 2 * #1#2 \if:w #1 - - \else: + \fi: 1 ) * #3 }

```

Now we append `sp` to finish the dimension specification.

```

21257 sp
21258 }
21259 }

```

(End of definition for `\dim_to_decimal_in_bp:n` and others. These functions are documented on page 236.)

`\dim_to_decimal_in_unit:nn`

```

21260 \cs_new:Npn \dim_to_decimal_in_unit:nn #1#2
21261 {
21262   \exp_after:wN \__dim_chk_unit:w
21263   \int_value:w \__dim_eval:w #2 \__dim_eval_end: \__dim_sep: {#1}
21264 }

```

(End of definition for `\dim_to_decimal_in_unit:nn`. This function is documented on page 237.)

`__dim_chk_unit:w` The tokens after `__dim_chk_unit:w` shall have the following form: `<number2>__dim_sep:{<dimexpr1>}`, where `<number2>` represents `<dimexpr2>` in `sp` unit. If `#1` is 0_{12} , the “unit” `<dimexpr2>` must also be zero. So we throw out a “division by zero” error message at this point. Otherwise, if `#1` is $-_{12}$, we shall negate both `<dimexpr1>` and `<dimexpr2>` for later procedures.

```

21265 \cs_new:Npn \__dim_chk_unit:w #1#2 \__dim_sep: #3
21266 {
21267   \token_if_eq_charcode:NNTF #1 0
21268   { \msg_expandable_error:nn { dim } { zero-unit } }
21269   {
21270     \exp_after:wN \__dim_branch_unit:w
21271     \int_value:w \if:w #1 - - \fi: \__dim_eval:w #3 \exp_after:wN \__dim_sep:
21272     \int_value:w \if:w #1 - - \fi: #1#2 \__dim_sep:
21273   }
21274 }

```

(End of definition for `__dim_chk_unit:w`.)

`__dim_branch_unit:w` The tokens after `__dim_branch_unit:w` shall have the following form: `<number1>__dim_sep:<number2>__dim_sep:`, where `<number1>` represents `<dimexpr1>` in `sp` unit (whose sign is taken care of) and `<number2>` represents the absolute value of `<dimexpr2>` in `sp` unit (which is strictly positive).

As explained, the formulae $(2X \pm 1) \times (\frac{1}{2}\delta^{-1})$ work if and only if $\delta = \text{<number2>/65536} > 1$. This corresponds to `<dimexpr2>` strictly larger than 1 pt in absolute value. In this case, we simply call `__dim_to_decimal_aux:w` and supply $\frac{1}{2}\delta^{-1} = 32768/\text{<number2>}$ as `<half of delta inverse>`.

Otherwise if `<number2> = 65536`, then `<dimexpr2>` is 1 pt in absolute value and we call `\dim_to_decimal:n` directly.

Otherwise $0 < \text{<number2>} < 65536$ and we shall proceed differently.

For unit less than 1 pt, write $n = \text{<number2>}$, then $\delta = n/65536 < 1$. The midpoint formulae are not optimal. Let’s go back to the inequalities $X\delta^{-1} \leq N < (X+1)\delta^{-1}$. Since now $\delta < 1$, the bounding interval is wider than 1 in length. Consider the ceiling integer $M = \lceil X\delta^{-1} \rceil$, then $X\delta^{-1} \leq M < (X+1)\delta^{-1}$, or equivalently $X \leq M\delta < X+1$, and thus $\lfloor M\delta \rfloor = X$. The key point here is that we *don’t* need to solve for N ; in fact,

any integer that can reproduce X (such as M) is good enough. So the algorithm goes like this: (1) Compute rounding of $X\delta^{-1}$, i.e., $M' = \lfloor X\delta^{-1} + \frac{1}{2} \rfloor$; this M' could be either M or $M - 1$. (2) Check if $\lfloor M'\delta \rfloor = X$, i.e., whether our candidate M' can reproduce X . If so, then this M' is good enough; if not, then we add one to M' .

But when $0 < n < 65536$, we cannot delay the problem of overflow any more. For $X\delta^{-1} = X \times 65536/n$, where X can go up to $2^{30} - 1$ and n can be as small as 1, the result is well over $2^{31} - 1$ (largest integer allowed within `\numexpr`). For example, `\dim_to_decimal_in_unit:nn { \maxdimen } { 1sp }`. Here, all inputs are legal, so we should be able to output 1073741823 *without* causing arithmetic overflow.

As a workaround, let's write $X = qn + r$ with some $q \geq 0$ and $0 \leq r < n$. Then $X\delta^{-1} = 65536q + 65536r/n$, and so $M' = 65536q + \lfloor 65536r/n + \frac{1}{2} \rfloor = 65536q + R'$. Computing R' will never overflow. If this R' can reproduce r , then it is good enough; otherwise we add one to R' . In the end, we shall output $q + R'/65536$ in decimal.

Note: $q = \lfloor X/n \rfloor = \lfloor \frac{2X-n}{2n} + \frac{1}{2} \rfloor$ represents the “integer” part, while $0 \leq R' \leq 65536$ represents the “fractional” part. (Can $R' = 65536$ really happen? Didn't investigate.)

```

21275 \cs_new:Npn \__dim_branch_unit:w #1 \__dim_sep: #2 \__dim_sep:
21276 {
21277   \int_compare:nNtF {#2} > { 65536 }
21278   { \__dim_to_decimal_aux:w #1 \__dim_sep: 32768 / #2 \__dim_sep: }
21279   {
21280     \int_compare:nNtF {#2} = { 65536 }
21281     { \dim_to_decimal:n { #1sp } }
21282     { \__dim_get_quotient:w #1 \__dim_sep: #2 \__dim_sep: }
21283   }
21284 }

```

(End of definition for `__dim_branch_unit:w`.)

`__dim_get_quotient:w` We wish to get the quotient q via rounding of $\frac{2X-n}{2n}$. When $0 \leq X < n/2$, we have $\frac{2X-n}{2n} < 0$. So, strictly speaking, `\numexpr` performs its rounding as $\lceil \frac{2X-n}{2n} - \frac{1}{2} \rceil$, not exactly what we want. However, lucky for us, only $X = 0$ makes $\lceil \frac{2X-n}{2n} - \frac{1}{2} \rceil = -1 \neq 0$ (we want 0); all other $0 < X < n/2$ make $\lceil \frac{2X-n}{2n} - \frac{1}{2} \rceil = 0 = q$. Thus, let's filter out $X = 0$ early. If $X \neq 0$, we extract its sign and leave the sign to the back. The sign does not participate in any calculations (also the code works with positive integers only). The sign is used at the last stages when we parse the decimal output.

After `__dim_get_quotient:w` has done its job, either we have the decimal 0, or we have `__dim_get_remainder:w` followed by $q \backslash _dim_sep: |X| \backslash _dim_sep: n \backslash _dim_sep: < \text{sign of } X > \backslash _dim_sep: .$

```

21285 \cs_new:Npn \__dim_get_quotient:w #1#2 \__dim_sep: #3 \__dim_sep:
21286 {
21287   \token_if_eq_charcode:NNTF #1 0
21288   { 0 }
21289   {
21290     \token_if_eq_charcode:NNTF #1 -
21291     {
21292       \exp_after:wN \exp_after:wN \exp_after:wN \__dim_get_remainder:w
21293       \int_eval:n { ( 2 * #2 - #3 ) / ( 2 * #3 ) } \__dim_sep:
21294       #2 \__dim_sep: #3 \__dim_sep: - \__dim_sep:
21295     }
21296     {
21297       \exp_after:wN \exp_after:wN \exp_after:wN \__dim_get_remainder:w
21298       \int_eval:n { ( 2 * #1#2 - #3 ) / ( 2 * #3 ) } \__dim_sep:

```

```

21299             #1#2 \__dim_sep: #3 \__dim_sep: \__dim_sep:
21300         }
21301     }
21302 }

```

(End of definition for __dim_get_quotient:w.)

```

\__dim_get_remainder:w \__dim_get_remainder:w does not need to read the sign. After finding the remainder  $r$ ,
the number  $|X|$  is no longer needed. We should then have \__dim_convert_remainder:w
followed by  $r \backslash \_ \_ \dim\_sep:n \backslash \_ \_ \dim\_sep:q \backslash \_ \_ \dim\_sep:<sign\ of\ X> \backslash \_ \_ \dim\_sep:.$ 
21303 \cs_new:Npn \__dim_get_remainder:w #1 \__dim_sep: #2 \__dim_sep: #3 \__dim_sep:
21304 {
21305     \exp_after:wN \exp_after:wN \exp_after:wN \__dim_convert_remainder:w
21306     \int_eval:n { #2 - #1 * #3 } \__dim_sep:
21307     #3 \__dim_sep: #1 \__dim_sep:
21308 }

```

(End of definition for __dim_get_remainder:w.)

```

\__dim_convert_remainder:w This is trivial. We compute  $R' = \lfloor 65536r/n + \frac{1}{2} \rfloor$ , then leave \__dim_test_candidate:w
followed by  $R' \backslash \_ \_ \dim\_sep:r \backslash \_ \_ \dim\_sep:n \backslash \_ \_ \dim\_sep:q \backslash \_ \_ \dim\_sep:<sign\ of\ X> \backslash \_ \_ \dim\_sep:.$ 
21309 \cs_new:Npn \__dim_convert_remainder:w #1 \__dim_sep: #2 \__dim_sep:
21310 {
21311     \exp_after:wN \exp_after:wN \exp_after:wN \__dim_test_candidate:w
21312     \int_eval:n { #1 * 65536 / #2 } \__dim_sep:
21313     #1 \__dim_sep: #2 \__dim_sep:
21314 }

```

(End of definition for __dim_convert_remainder:w.)

```

\__dim_test_candidate:w Now the fun part: We take  $R'$ ,  $r$  and  $n$  to test whether  $r = \lfloor R'\delta \rfloor$ . This is done as
a dimension comparison. The left-hand side,  $r$ , is simply  $r\ sp$ . The right-hand side,
 $\lfloor R'\delta \rfloor$ , is exactly  $<R' as decimal><dimen = n\ sp>$ . If the result is true, then we've
found  $R'$ ; otherwise we add one to  $R'$ . After this step,  $r$  and  $n$  are no longer needed.
We should then have \__dim_parse_decimal:w followed by  $R' \backslash \_ \_ \dim\_sep:q \backslash \_ \_ \dim\_sep:<sign\ of\ X> \backslash \_ \_ \dim\_sep:.$ 
21315 \cs_new:Npn \__dim_test_candidate:w #1 \__dim_sep: #2 \__dim_sep: #3 \__dim_sep:
21316 {
21317     \dim_compare:nNnTF { #2sp } =
21318     { \dim_to_decimal:n { #1sp } \__dim_eval:w #3sp \__dim_eval_end: }
21319     { \__dim_parse_decimal:w #1 \__dim_sep: }
21320     {
21321         \__dim_parse_decimal:w \int_eval:n { #1 + 1 } \__dim_sep:
21322     }
21323 }

```

(End of definition for __dim_test_candidate:w.)

```

\__dim_parse_decimal:w \__dim_parse_decimal_aux:w The Grand Finale: We sum  $q$  and  $R'/65536$  together, and negate the result if necessary.
These are all done expandably. If  $0 < R'/65536 < 1$ , the integer summation is naturally
terminated at the decimal point. If  $R'/65536 = 0$  (or  $1?$ ), the summation is terminated
at the \__dim_sep:.. The auxiliary function \__dim_parse_decimal_aux:w takes care
of both cases.

```

```

21324 \cs_new:Npn \__dim_parse_decimal:w #1 \__dim_sep: #2 \__dim_sep: #3 \__dim_sep:
21325 {
21326     \exp_after:wN \__dim_parse_decimal_aux:w
21327     \int_value:w #3 \int_eval:w #2 + \dim_to_decimal:n { #1sp } \__dim_sep:
21328 }
21329 \cs_new:Npn \__dim_parse_decimal_aux:w #1 \__dim_sep: {#1}

```

(End of definition for `__dim_parse_decimal:w` and `__dim_parse_decimal_aux:w`.)

67.11 Viewing dim variables

`\dim_show:N` Diagnostics.

```

\dim_show:c 21330 \cs_new_eq:NN \dim_show:N \__kernel_register_show:N
21331 \cs_generate_variant:Nn \dim_show:N { c }

```

(End of definition for `\dim_show:N`. This function is documented on page 237.)

`\dim_show:n` Diagnostics. We don't use the \TeX primitive `\showthe` to show dimension expressions: this gives a more unified output.

```

21332 \cs_new_protected:Npn \dim_show:n
21333 { \__kernel_msg_show_eval:Nn \dim_eval:n }

```

(End of definition for `\dim_show:n`. This function is documented on page 237.)

`\dim_log:N` Diagnostics. Redirect output of `\dim_show:n` to the log.

```

\dim_log:c 21334 \cs_new_eq:NN \dim_log:N \__kernel_register_log:N
\dim_log:n 21335 \cs_new_eq:NN \dim_log:c \__kernel_register_log:c
21336 \cs_new_protected:Npn \dim_log:n
21337 { \__kernel_msg_log_eval:Nn \dim_eval:n }

```

(End of definition for `\dim_log:N` and `\dim_log:n`. These functions are documented on page 237.)

67.12 Constant dimensions

`\c_zero_dim` Constant dimensions.

```

\c_max_dim 21338 \dim_const:Nn \c_zero_dim { 0 pt }
21339 \dim_const:Nn \c_max_dim { 16383.99999 pt }

```

(End of definition for `\c_zero_dim` and `\c_max_dim`. These variables are documented on page 238.)

67.13 Scratch dimensions

`\l_tmpa_dim` We provide two local and two global scratch registers, maybe we need more or less.

```

\l_tmpb_dim 21340 \dim_new:N \l_tmpa_dim
\g_tmpa_dim 21341 \dim_new:N \l_tmpb_dim
\g_tmpb_dim 21342 \dim_new:N \g_tmpa_dim
21343 \dim_new:N \g_tmpb_dim

```

(End of definition for `\l_tmpa_dim` and others. These variables are documented on page 238.)

67.14 Creating and initialising skip variables

21344 <@@=skip>
\skip_stop Internal scan marks.
21345 \scan_new:N \skip_stop
(End of definition for \skip_stop.)

\skip_new:N Allocation of a new internal registers.

21346 \cs_new_protected:Npn \skip_new:N #1
21347 {
21348 __kernel_chk_if_free_cs:N #1
21349 \cs:w newskip \cs_end: #1
21350 }
21351 \cs_generate_variant:Nn \skip_new:N { c }

(End of definition for \skip_new:N. This function is documented on page 238.)

\skip_const:N Contrarily to integer constants, we cannot avoid using a register, even for constants. See
\skip_const:cn \dim_const:Nn for why we cannot use \skip_gset:Nn.
21352 \cs_new_protected:Npn \skip_const:Nn #1#2
21353 {
21354 \skip_new:N #1
21355 \tex_global:D #1 = \skip_eval:n {#2} \scan_stop:
21356 }
21357 \cs_generate_variant:Nn \skip_const:Nn { c }

(End of definition for \skip_const:Nn. This function is documented on page 238.)

\skip_zero:N Reset the register to zero.
\skip_zero:c
\skip_gzero:N
\skip_gzero:c
21358 \cs_new_eq:NN \skip_zero:N \dim_zero:N
21359 \cs_new_eq:NN \skip_gzero:N \dim_gzero:N
21360 \cs_generate_variant:Nn \skip_zero:N { c }
21361 \cs_generate_variant:Nn \skip_gzero:N { c }

(End of definition for \skip_zero:N and \skip_gzero:N. These functions are documented on page 238.)

\skip_zero_new:N Create a register if needed, otherwise clear it.
\skip_zero_new:c
\skip_gzero_new:N
\skip_gzero_new:c
21362 \cs_new_protected:Npn \skip_zero_new:N #1
21363 { \skip_if_exist:NTF #1 { \skip_zero:N #1 } { \skip_new:N #1 } }
21364 \cs_new_protected:Npn \skip_gzero_new:N #1
21365 { \skip_if_exist:NTF #1 { \skip_gzero:N #1 } { \skip_new:N #1 } }
21366 \cs_generate_variant:Nn \skip_zero_new:N { c }
21367 \cs_generate_variant:Nn \skip_gzero_new:N { c }

(End of definition for \skip_zero_new:N and \skip_gzero_new:N. These functions are documented on page 239.)

\skip_if_exist_p:N Copies of the cs functions defined in l3basics.
\skip_if_exist_p:c
\skip_if_exist:NTF
\skip_if_exist:cTF
21368 \prg_new_eq_conditional:NNn \skip_if_exist:N \cs_if_exist:N
21369 { TF , T , F , p }
21370 \prg_new_eq_conditional:NNn \skip_if_exist:c \cs_if_exist:c
21371 { TF , T , F , p }

(End of definition for \skip_if_exist:NTF. This function is documented on page 239.)

67.15 Setting skip variables

`\skip_set:Nn` Much the same as for dimensions.

```
\skip_set:cn 21372 \cs_new_protected:Npn \skip_set:Nn #1#2
\skip_set:NV 21373 { #1 = \tex_glueexpr:D #2 \scan_stop: }
\skip_set:cV 21374 \cs_new_protected:Npn \skip_gset:Nn #1#2
\skip_gset:Nn 21375 { \tex_global:D #1 = \tex_glueexpr:D #2 \scan_stop: }
\skip_gset:cn 21376 \cs_generate_variant:Nn \skip_set:Nn { NV , c , cV }
\skip_gset:NV 21377 \cs_generate_variant:Nn \skip_gset:Nn { NV , c , cV }
\skip_gset:cV
```

(End of definition for `\skip_set:Nn` and `\skip_gset:Nn`. These functions are documented on page 239.)

`\skip_set_eq:NN` All straightforward.

```
\skip_set_eq:cn 21378 \cs_new_protected:Npn \skip_set_eq:NN #1#2 { #1 = #2 }
\skip_set_eq:Nc 21379 \cs_generate_variant:Nn \skip_set_eq:NN { c , Nc , cc }
\skip_set_eq:cc 21380 \cs_new_protected:Npn \skip_gset_eq:NN #1#2 { \tex_global:D #1 = #2 }
\skip_gset_eq:Nn 21381 \cs_generate_variant:Nn \skip_gset_eq:NN { c , Nc , cc }
```

(End of definition for `\skip_set_eq:NN` and `\skip_gset_eq:NN`. These functions are documented on page 239.)

`\skip_add:Nn` Using by here deals with the (incorrect) case `\skip123`.

```
\skip_add:cn 21382 \cs_new_protected:Npn \skip_add:Nn #1#2
\skip_gadd:Nn 21383 { \tex_advance:D #1 \tex_glueexpr:D #2 \scan_stop: }
\skip_gadd:cn 21384 \cs_new_protected:Npn \skip_gadd:Nn #1#2
\skip_sub:Nn 21385 { \tex_global:D \tex_advance:D #1 \tex_glueexpr:D #2 \scan_stop: }
\skip_sub:cn 21386 \cs_generate_variant:Nn \skip_add:Nn { c }
\skip_gsub:Nn 21387 \cs_generate_variant:Nn \skip_gadd:Nn { c }
\skip_gsub:cn 21388 \cs_new_protected:Npn \skip_sub:Nn #1#2
21389 { \tex_advance:D #1 - \tex_glueexpr:D #2 \scan_stop: }
21390 \cs_new_protected:Npn \skip_gsub:Nn #1#2
21391 { \tex_global:D \tex_advance:D #1 - \tex_glueexpr:D #2 \scan_stop: }
21392 \cs_generate_variant:Nn \skip_sub:Nn { c }
21393 \cs_generate_variant:Nn \skip_gsub:Nn { c }
```

(End of definition for `\skip_add:Nn` and others. These functions are documented on page 239.)

67.16 Skip expression conditionals

`\skip_if_eq_p:nn` Comparing skips means doing two expansions to make strings, and then testing them.
`\skip_if_eq:nnTF` As a result, only equality is tested.

```
21394 \prg_new_conditional:Npnn \skip_if_eq:nn #1#2 { p , T , F , TF }
21395 {
21396   \str_if_eq:eeTF { \skip_eval:n {#1} } { \skip_eval:n {#2} }
21397   { \prg_return_true: }
21398   { \prg_return_false: }
21399 }
```

(End of definition for `\skip_if_eq:nnTF`. This function is documented on page 240.)

`__skip_sep:`

```
21400 \cs_new_eq:NN __skip_sep: __kernel_int_sep:
```

(End of definition for `__skip_sep:.`)

`\skip_if_finite:p:n` With ε -TeX, we have an easy access to the order of infinities of the stretch and shrink components of a skip. However, to access both, we either need to evaluate the expression twice, or evaluate it, then call an auxiliary to extract both pieces of information from the result. Since we are going to need an auxiliary anyways, it is quicker to make it search for the string `fil` which characterizes infinite glue.

```

21401 \cs_set_protected:Npn \__skip_tmp:w #1
21402 {
21403   \prg_new_conditional:Npnn \skip_if_finite:n ##1 { p , T , F , TF }
21404   {
21405     \exp_after:wN \__skip_if_finite:wwNw
21406     \skip_use:N \tex_glueexpr:D ##1 \__skip_sep: \prg_return_false:
21407     #1 \__skip_sep: \prg_return_true: \s__skip_stop
21408   }
21409   \cs_new:Npn \__skip_if_finite:wwNw ##1 #1 ##2 \__skip_sep: ##3 ##4 \s__skip_stop {##3}
21410 }
21411 \exp_args:No \__skip_tmp:w { \tl_to_str:n { fil } }

```

(End of definition for `\skip_if_finite:nTF` and `__skip_if_finite:wwNw`. This function is documented on page 240.)

67.17 Using skip expressions and variables

`\skip_eval:n` Evaluating a skip expression expandably.

```

21412 \cs_new:Npn \skip_eval:n #1
21413 { \skip_use:N \tex_glueexpr:D #1 \scan_stop: }

```

(End of definition for `\skip_eval:n`. This function is documented on page 240.)

`\skip_use:N` Accessing a $\langle skip \rangle$.

```

\skip_use:c 21414 \cs_new_eq:NN \skip_use:N \dim_use:N
21415 \cs_new_eq:NN \skip_use:c \dim_use:c

```

(End of definition for `\skip_use:N`. This function is documented on page 240.)

67.18 Inserting skips into the output

`\skip_horizontal:N` Inserting skips.

```

\skip_horizontal:c 21416 \cs_new_eq:NN \skip_horizontal:N \tex_hskip:D
\skip_horizontal:n 21417 \cs_new:Npn \skip_horizontal:n #1
\skip_vertical:N 21418 { \skip_horizontal:N \tex_glueexpr:D #1 \scan_stop: }
\skip_vertical:c 21419 \cs_new_eq:NN \skip_vertical:N \tex_vskip:D
\skip_vertical:n 21420 \cs_new:Npn \skip_vertical:n #1
21421 { \skip_vertical:N \tex_glueexpr:D #1 \scan_stop: }
21422 \cs_generate_variant:Nn \skip_horizontal:N { c }
21423 \cs_generate_variant:Nn \skip_vertical:N { c }

```

(End of definition for `\skip_horizontal:N` and others. These functions are documented on page 241.)

67.19 Viewing skip variables

`\skip_show:N` Diagnostics.

`\skip_show:c` 21424 `\cs_new_eq:NN \skip_show:N __kernel_register_show:N`
 21425 `\cs_generate_variant:Nn \skip_show:N { c }`

(End of definition for \skip_show:N. This function is documented on page 240.)

`\skip_show:n` Diagnostics. We don't use the T_EX primitive `\showthe` to show skip expressions: this gives a more unified output.

21426 `\cs_new_protected:Npn \skip_show:n`
 21427 `{ __kernel_msg_show_eval:Nn \skip_eval:n }`

(End of definition for \skip_show:n. This function is documented on page 240.)

`\skip_log:N` Diagnostics. Redirect output of `\skip_show:n` to the log.

`\skip_log:c` 21428 `\cs_new_eq:NN \skip_log:N __kernel_register_log:N`
`\skip_log:n` 21429 `\cs_new_eq:NN \skip_log:c __kernel_register_log:c`
 21430 `\cs_new_protected:Npn \skip_log:n`
 21431 `{ __kernel_msg_log_eval:Nn \skip_eval:n }`

(End of definition for \skip_log:N and \skip_log:n. These functions are documented on page 241.)

67.20 Constant skips

`\c_zero_skip` Skips with no rubber component are just dimensions but need to terminate correctly.

`\c_max_skip` 21432 `\skip_const:Nn \c_zero_skip { \c_zero_dim }`
 21433 `\skip_const:Nn \c_max_skip { \c_max_dim }`

(End of definition for \c_zero_skip and \c_max_skip. These functions are documented on page 241.)

67.21 Scratch skips

`\l_tmpa_skip` We provide two local and two global scratch registers, maybe we need more or less.

`\l_tmpb_skip` 21434 `\skip_new:N \l_tmpa_skip`
`\g_tmpa_skip` 21435 `\skip_new:N \l_tmpb_skip`
`\g_tmpb_skip` 21436 `\skip_new:N \g_tmpa_skip`
 21437 `\skip_new:N \g_tmpb_skip`

(End of definition for \l_tmpa_skip and others. These variables are documented on page 241.)

67.22 Creating and initialising muskip variables

`\muskip_new:N` And then we add muskips.

`\muskip_new:c` 21438 `\cs_new_protected:Npn \muskip_new:N #1`
 21439 `{`
 21440 `__kernel_chk_if_free_cs:N #1`
 21441 `\cs:w newmuskip \cs_end: #1`
 21442 `}`
 21443 `\cs_generate_variant:Nn \muskip_new:N { c }`

(End of definition for \muskip_new:N. This function is documented on page 242.)

```

\muskip_const:Nn See \skip_const:Nn.
\muskip_const:cn 21444 \cs_new_protected:Npn \muskip_const:Nn #1#2
                  21445 {
                  21446   \muskip_new:N #1
                  21447   \tex_global:D #1 = \muskip_eval:n {#2} \scan_stop:
                  21448 }
                  21449 \cs_generate_variant:Nn \muskip_const:Nn { c }

```

(End of definition for \muskip_const:Nn. This function is documented on page 242.)

```

\muskip_zero:N Reset the register to zero.
\muskip_zero:c 21450 \cs_new_protected:Npn \muskip_zero:N #1
\muskip_gzero:N 21451 { #1 = \c_zero_muskip }
\muskip_gzero:c 21452 \cs_new_protected:Npn \muskip_gzero:N #1
                  21453 { \tex_global:D #1 = \c_zero_muskip }
                  21454 \cs_generate_variant:Nn \muskip_zero:N { c }
                  21455 \cs_generate_variant:Nn \muskip_gzero:N { c }

```

(End of definition for \muskip_zero:N and \muskip_gzero:N. These functions are documented on page 242.)

```

\muskip_zero_new:N Create a register if needed, otherwise clear it.
\muskip_zero_new:c 21456 \cs_new_protected:Npn \muskip_zero_new:N #1
\muskip_gzero_new:N 21457 { \muskip_if_exist:NTF #1 { \muskip_zero:N #1 } { \muskip_new:N #1 } }
\muskip_gzero_new:c 21458 \cs_new_protected:Npn \muskip_gzero_new:N #1
                  21459 { \muskip_if_exist:NTF #1 { \muskip_gzero:N #1 } { \muskip_new:N #1 } }
                  21460 \cs_generate_variant:Nn \muskip_zero_new:N { c }
                  21461 \cs_generate_variant:Nn \muskip_gzero_new:N { c }

```

(End of definition for \muskip_zero_new:N and \muskip_gzero_new:N. These functions are documented on page 242.)

```

\muskip_if_exist_p:N Copies of the cs functions defined in l3basics.
\muskip_if_exist_p:c 21462 \prg_new_eq_conditional:NNn \muskip_if_exist:N \cs_if_exist:N
\muskip_if_exist:NTF 21463 { TF , T , F , p }
\muskip_if_exist:cTF 21464 \prg_new_eq_conditional:NNn \muskip_if_exist:c \cs_if_exist:c
                  21465 { TF , T , F , p }

```

(End of definition for \muskip_if_exist:NTF. This function is documented on page 242.)

67.23 Setting muskip variables

```

\muskip_set:Nn This should be pretty familiar.
\muskip_set:cn 21466 \cs_new_protected:Npn \muskip_set:Nn #1#2
\muskip_set:NV 21467 { #1 = \tex_muexpr:D #2 \scan_stop: }
\muskip_set:cV 21468 \cs_new_protected:Npn \muskip_gset:Nn #1#2
\muskip_gset:Nn 21469 { \tex_global:D #1 = \tex_muexpr:D #2 \scan_stop: }
\muskip_gset:cn 21470 \cs_generate_variant:Nn \muskip_set:Nn { NV , c , cV }
\muskip_gset:NV 21471 \cs_generate_variant:Nn \muskip_gset:Nn { NV , c , cV }
\muskip_gset:cV

```

(End of definition for \muskip_set:Nn and \muskip_gset:Nn. These functions are documented on page 243.)

`\muskip_set_eq:NN` All straightforward.

```

\muskip_set_eq:cN 21472 \cs_new_protected:Npn \muskip_set_eq:NN #1#2 { #1 = #2 }
\muskip_set_eq:Nc 21473 \cs_generate_variant:Nn \muskip_set_eq:NN { c , Nc , cc }
\muskip_set_eq:cc 21474 \cs_new_protected:Npn \muskip_gset_eq:NN #1#2 { \tex_global:D #1 = #2 }
\muskip_gset_eq:NN 21475 \cs_generate_variant:Nn \muskip_gset_eq:NN { c , Nc , cc }
\muskip_gset_eq:cN
\muskip_gset_eq:Nc
\muskip_gset_eq:cc

```

(End of definition for `\muskip_set_eq:NN` and `\muskip_gset_eq:NN`. These functions are documented on page 243.)

`\muskip_add:Nn` Using by here deals with the (incorrect) case `\muskip123`.

```

\muskip_add:cN 21476 \cs_new_protected:Npn \muskip_add:Nn #1#2
\muskip_gadd:Nn 21477 { \tex_advance:D #1 \tex_muexpr:D #2 \scan_stop: }
\muskip_gadd:cN 21478 \cs_new_protected:Npn \muskip_gadd:Nn #1#2
\muskip_sub:Nn 21479 { \tex_global:D \tex_advance:D #1 \tex_muexpr:D #2 \scan_stop: }
\muskip_sub:cN 21480 \cs_generate_variant:Nn \muskip_add:Nn { c }
\muskip_gsub:Nn 21481 \cs_generate_variant:Nn \muskip_gadd:Nn { c }
\muskip_gsub:cN 21482 \cs_new_protected:Npn \muskip_sub:Nn #1#2
21483 { \tex_advance:D #1 - \tex_muexpr:D #2 \scan_stop: }
21484 \cs_new_protected:Npn \muskip_gsub:Nn #1#2
21485 { \tex_global:D \tex_advance:D #1 - \tex_muexpr:D #2 \scan_stop: }
21486 \cs_generate_variant:Nn \muskip_sub:Nn { c }
21487 \cs_generate_variant:Nn \muskip_gsub:Nn { c }

```

(End of definition for `\muskip_add:Nn` and others. These functions are documented on page 242.)

67.24 Using muskip expressions and variables

`\muskip_eval:n` Evaluating a muskip expression expandably.

```

21488 \cs_new:Npn \muskip_eval:n #1
21489 { \muskip_use:N \tex_muexpr:D #1 \scan_stop: }

```

(End of definition for `\muskip_eval:n`. This function is documented on page 243.)

`\muskip_use:N` Accessing a `\muskip`.

```

\muskip_use:c 21490 \cs_new_eq:NN \muskip_use:N \dim_use:N
21491 \cs_new_eq:NN \muskip_use:c \dim_use:c

```

(End of definition for `\muskip_use:N`. This function is documented on page 243.)

67.25 Viewing muskip variables

`\muskip_show:N` Diagnostics.

```

\muskip_show:c 21492 \cs_new_eq:NN \muskip_show:N \__kernel_register_show:N
21493 \cs_generate_variant:Nn \muskip_show:N { c }

```

(End of definition for `\muskip_show:N`. This function is documented on page 243.)

`\muskip_show:n` Diagnostics. We don't use the \TeX primitive `\showthe` to show muskip expressions: this gives a more unified output.

```

21494 \cs_new_protected:Npn \muskip_show:n
21495 { \__kernel_msg_show_eval:Nn \muskip_eval:n }

```

(End of definition for `\muskip_show:n`. This function is documented on page 244.)

`\muskip_log:N` Diagnostics. Redirect output of `\muskip_show:n` to the log.

`\muskip_log:c` 21496 `\cs_new_eq:NN \muskip_log:N __kernel_register_log:N`

`\muskip_log:n` 21497 `\cs_new_eq:NN \muskip_log:c __kernel_register_log:c`

21498 `\cs_new_protected:Npn \muskip_log:n`

21499 `{ __kernel_msg_log_eval:Nn \muskip_eval:n }`

(End of definition for `\muskip_log:N` and `\muskip_log:n`. These functions are documented on page 244.)

67.26 Constant muskips

`\c_zero_muskip` Constant muskips given by their value.

`\c_max_muskip` 21500 `\muskip_const:Nn \c_zero_muskip { 0 mu }`

21501 `\muskip_const:Nn \c_max_muskip { 16383.99999 mu }`

(End of definition for `\c_zero_muskip` and `\c_max_muskip`. These functions are documented on page 244.)

67.27 Scratch muskips

`\l_tmpa_muskip` We provide two local and two global scratch registers, maybe we need more or less.

`\l_tmpb_muskip` 21502 `\muskip_new:N \l_tmpa_muskip`

`\g_tmpa_muskip` 21503 `\muskip_new:N \l_tmpb_muskip`

`\g_tmpb_muskip` 21504 `\muskip_new:N \g_tmpa_muskip`

21505 `\muskip_new:N \g_tmpb_muskip`

(End of definition for `\l_tmpa_muskip` and others. These variables are documented on page 244.)

21506 `\code`

Chapter 68

l3keys implementation

21507 $\langle *code \rangle$

68.1 Low-level interface

The low-level key parser's implementation is based heavily on `expkv`. Compared to `keyval` it adds a number of additional “safety” requirements and allows to process the parsed list of key–value pairs in a variety of ways. The net result is that this code needs around one and a half the amount of time as `keyval` to parse the same list of keys. To optimise speed as far as reasonably practical, a number of lower-level approaches are taken rather than using the higher-level `expl3` interfaces.

21508 $\langle @@=keyval \rangle$

```
\s__keyval_nil
\s__keyval_mark
\s__keyval_stop
\s__keyval_tail
21509 \scan_new:N \s__keyval_nil
21510 \scan_new:N \s__keyval_mark
21511 \scan_new:N \s__keyval_stop
21512 \scan_new:N \s__keyval_tail
```

(End of definition for `\s__keyval_nil` and others.)

`\l__kernel_keyval_allow_blank_keys_bool`

The general behavior of the `l3keys` module is to throw an error on blank key names. However to support the usage of `\keyval_parse:nnn` in the `l3prop` module we allow this error to be switched off temporarily and just ignore blank names.

21513 \backslash bool_new:N \backslash l__kernel_keyval_allow_blank_keys_bool

(End of definition for `\l__kernel_keyval_allow_blank_keys_bool`.)

This temporary macro will be used since some of the definitions will need an active comma or equals sign. Inside of this macro `#1` will be the active comma and `#2` will be the active equals sign.

```
21514 \group_begin:
21515   \cs_set_protected:Npn \__keyval_tmp:w #1#2
21516   {
```

```
\keyval_parse:nnn
\keyval_parse:nnV
\keyval_parse:nnv
\keyval_parse:NNn
\keyval_parse:NNV
\keyval_parse:NNv
```

The main function starts the first of two loops. The outer loop splits the key–value list at active commas, the inner loop will do so at other commas. The use of `\s__keyval_mark` here prevents loss of braces from the key argument.

```

21517 \cs_new:Npn \keyval_parse:nnn ##1 ##2 ##3
21518 {
21519     \__kernel_exp_not:w \tex_expanded:D
21520     {
21521         {
21522             \__keyval_loop_active:nnw {##1} {##2}
21523             \s__keyval_mark ##3 #1 \s__keyval_tail #1
21524         }
21525     }
21526 }
21527 \cs_new_eq:NN \keyval_parse:NNn \keyval_parse:nnn

```

(End of definition for \keyval_parse:nnn and \keyval_parse:NNn. These functions are documented on page 259.)

__keyval_loop_active:nnw First a fast test for the end of the loop is done, it'll gobble everything up to a \s__keyval_tail. The loop ending macro will gobble everything to the last comma in this definition. If the end isn't reached yet, start the second loop splitting at other commas, the next iteration of this first loop will be inserted by the end of __keyval_loop_other:nnw.

```

21528 \cs_new:Npn \__keyval_loop_active:nnw ##1 ##2 ##3 #1
21529 {
21530     \__keyval_if_recursion_tail:w ##3
21531     \__keyval_end_loop_active:w \s__keyval_tail
21532     \__keyval_loop_other:nnw {##1} {##2} ##3 , \s__keyval_tail ,
21533 }

```

(End of definition for __keyval_loop_active:nnw.)

__keyval_split_other:w These two macros allow to split at the first equals sign of category 12 or 13. At the same time they also execute branching by inserting the first token following \s__keyval_mark that followed the equals sign. Hence they also test for the presence of such an equals sign simultaneously.

```

21534 \cs_new:Npn \__keyval_split_other:w ##1 = ##2 \s__keyval_mark ##3
21535 { ##3 ##1 \s__keyval_stop \s__keyval_mark ##2 }
21536 \cs_new:Npn \__keyval_split_active:w ##1 #2 ##2 \s__keyval_mark ##3
21537 { ##3 ##1 \s__keyval_stop \s__keyval_mark ##2 }

```

(End of definition for __keyval_split_other:w and __keyval_split_active:w.)

__keyval_loop_other:nnw The second loop uses the same test for its end as the first loop, next it splits at the first active equals sign using __keyval_split_active:w. The \s__keyval_nil prevents accidental brace stripping and acts as a delimiter in the next steps. First testing for an active equals sign will reduce the number of necessary expansion steps for the expected average use case of other equals signs and hence perform better on average.

```

21538 \cs_new:Npn \__keyval_loop_other:nnw ##1 ##2 ##3 ,
21539 {
21540     \__keyval_if_recursion_tail:w ##3
21541     \__keyval_end_loop_other:w \s__keyval_tail
21542     \__keyval_split_active:w ##3 \s__keyval_nil
21543     \s__keyval_mark \__keyval_split_active_auxi:w
21544     #2 \s__keyval_mark \__keyval_clean_up_active:w
21545     {##1} {##2}
21546     \s__keyval_mark
21547 }

```

(End of definition for _keyval_loop_other:nnw.)

_keyval_split_active_auxi:w After _keyval_split_active:w the following will only be called if there was at least one active equals sign in the current key-value pair. Therefore this is the execution branch for a key-value pair with an active equals sign. ##1 will be everything up to the first active equals sign. First it tests for other equals signs in the key name, which will eventually throw an error via _keyval_misplaced_equal_after_active_error:w. If none was found we forward the key to _keyval_split_active_auxii:w.

```

21548     \cs_new:Npn \_keyval_split_active_auxi:w ##1 \s__keyval_stop
21549     {
21550         \_keyval_split_other:w ##1 \s__keyval_nil
21551         \s__keyval_mark \_keyval_misplaced_equal_after_active_error:w
21552         = \s__keyval_mark \_keyval_split_active_auxii:w
21553     }

```

_keyval_split_active_auxii:w gets the correct key name with a leading \s__keyval_mark as ##1. It has to sanitise the remainder of the previous test and trims the key name which will be forwarded to _keyval_split_active_auxiii:w.

```

21554     \cs_new:Npn \_keyval_split_active_auxii:w
21555     ##1 \s__keyval_nil \s__keyval_mark \_keyval_misplaced_equal_after_active_error:w
21556     \s__keyval_stop \s__keyval_mark
21557     ##2 \s__keyval_nil #2 \s__keyval_mark \_keyval_clean_up_active:w
21558     { \_keyval_trim:nN {##1} \_keyval_split_active_auxiii:w ##2 \s__keyval_nil }

```

Next we test for a misplaced active equals sign in the value, if none is found _keyval_split_active_auxiv:w will be called.

```

21559     \cs_new:Npn \_keyval_split_active_auxiii:w ##1 ##2 \s__keyval_nil
21560     {
21561         \_keyval_split_active:w ##2 \s__keyval_nil
21562         \s__keyval_mark \_keyval_misplaced_equal_in_split_error:w
21563         #2 \s__keyval_mark \_keyval_split_active_auxiv:w
21564         {##1}
21565     }

```

This runs the last test after sanitising the remainder of the previous one. This time test for a misplaced equals sign of category 12 in the value. Finally the last auxiliary macro will be called.

```

21566     \cs_new:Npn \_keyval_split_active_auxiv:w
21567     ##1 \s__keyval_nil \s__keyval_mark \_keyval_misplaced_equal_in_split_error:w
21568     \s__keyval_stop \s__keyval_mark
21569     {
21570         \_keyval_split_other:w ##1 \s__keyval_nil
21571         \s__keyval_mark \_keyval_misplaced_equal_in_split_error:w
21572         = \s__keyval_mark \_keyval_split_active_auxv:w
21573     }

```

This last macro in this execution branch sanitises the last test, trims the value and passes it to _keyval_pair:nnnn.

```

21574     \cs_new:Npn \_keyval_split_active_auxv:w
21575     ##1 \s__keyval_nil \s__keyval_mark \_keyval_misplaced_equal_in_split_error:w
21576     \s__keyval_stop \s__keyval_mark
21577     { \_keyval_trim:nN { ##1 } \_keyval_pair:nnnn }

```

(End of definition for _keyval_split_active_auxi:w and others.)

`__keyval_clean_up_active:w` The following is the branch taken if the key-value pair doesn't contain an active equals sign. The remainder of that test will be cleaned up by `__keyval_clean_up_active:w` which will then split at an equals sign of category other.

```

21578     \cs_new:Npn \__keyval_clean_up_active:w
21579         ##1 \s__keyval_nil \s__keyval_mark \__keyval_split_active_auxi:w \s__keyval_stop
21580     {
21581         \__keyval_split_other:w ##1 \s__keyval_nil
21582         \s__keyval_mark \__keyval_split_other_auxi:w
21583         = \s__keyval_mark \__keyval_clean_up_other:w
21584     }

```

(End of definition for __keyval_clean_up_active:w.)

`__keyval_split_other_auxi:w` This is executed if the key-value pair doesn't contain an active equals sign but at least one other. `##1` of `__keyval_split_other_auxi:w` will contain the complete key name, which is trimmed and forwarded to the next auxiliary macro.

`__keyval_split_other_auxii:w`
`__keyval_split_other_auxiii:w`

```

21585     \cs_new:Npn \__keyval_split_other_auxi:w ##1 \s__keyval_stop
21586     { \__keyval_trim:nN { ##1 } \__keyval_split_other_auxii:w }

```

We know that the value doesn't contain misplaced active equals signs but we have to test for others. Also we need to sanitise the previous test, which is done here and not earlier to avoid superfluous argument grabbing.

```

21587     \cs_new:Npn \__keyval_split_other_auxii:w
21588         ##1 ##2 \s__keyval_nil = \s__keyval_mark \__keyval_clean_up_other:w
21589     {
21590         \__keyval_split_other:w ##2 \s__keyval_nil
21591         \s__keyval_mark \__keyval_misplaced_equal_in_split_error:w
21592         = \s__keyval_mark \__keyval_split_other_auxiii:w
21593         { ##1 }
21594     }

```

`__keyval_split_other_auxiii:w` sanitises the test for other equals signs, trims the value and forwards it to `__keyval_pair:nnnn`.

```

21595     \cs_new:Npn \__keyval_split_other_auxiii:w
21596         ##1 \s__keyval_nil \s__keyval_mark \__keyval_misplaced_equal_in_split_error:w
21597         \s__keyval_stop \s__keyval_mark
21598         { \__keyval_trim:nN { ##1 } \__keyval_pair:nnnn }

```

(End of definition for __keyval_split_other_auxi:w, __keyval_split_other_auxii:w, and __keyval_split_other_auxiii:w.)

`__keyval_clean_up_other:w` `__keyval_clean_up_other:w` is the last branch that might exist. It is called if no equals sign was found, hence the only possibilities left are a blank list element, which is to be skipped, or a lonely key. If it's no empty list element this will trim the key name and forward it to `__keyval_key:nn`.

```

21599     \cs_new:Npn \__keyval_clean_up_other:w
21600         ##1 \s__keyval_nil \s__keyval_mark \__keyval_split_other_auxi:w \s__keyval_stop \
21601     {
21602         \__keyval_if_blank:w ##1 \s__keyval_nil \s__keyval_stop \__keyval_blank_true:w
21603         \s__keyval_mark \s__keyval_stop
21604         \__keyval_trim:nN { ##1 } \__keyval_key:nn
21605     }

```

(End of definition for __keyval_clean_up_other:w.)

keyval_misplaced_equal_after_active_error:w
 _keyval_misplaced_equal_in_split_error:w

All these two macros do is gobble the remainder of the current other loop execution and throw an error. Afterwards they have to insert the next loop iteration.

```

21606 \cs_new:Npn \_keyval_misplaced_equal_after_active_error:w
21607 \s__keyval_mark ##1 \s__keyval_stop \s__keyval_mark ##2 \s__keyval_nil
21608 = \s__keyval_mark \_keyval_split_active_auxii:w
21609 \s__keyval_mark ##3 \s__keyval_nil
21610 #2 \s__keyval_mark \_keyval_clean_up_active:w
21611 {
21612 \msg_expandable_error:nn
21613 { keyval } { misplaced-equals-sign }
21614 \_keyval_loop_other:nnw
21615 }
21616 \cs_new:Npn \_keyval_misplaced_equal_in_split_error:w
21617 \s__keyval_mark ##1 \s__keyval_stop \s__keyval_mark ##2 \s__keyval_nil
21618 ##3 \s__keyval_mark ##4 ##5
21619 {
21620 \msg_expandable_error:nn
21621 { keyval } { misplaced-equals-sign }
21622 \_keyval_loop_other:nnw
21623 }

```

(End of definition for _keyval_misplaced_equal_after_active_error:w and _keyval_misplaced_equal_in_split_error:w.)

_keyval_end_loop_other:w
 _keyval_end_loop_active:w

All that's left for the parsing loops are the macros which end the recursion. Both just gobble the remaining tokens of the respective loop including the next recursion call. _keyval_end_loop_other:w also has to insert the next iteration of the active loop.

```

21624 \cs_new:Npn \_keyval_end_loop_other:w
21625 \s__keyval_tail
21626 \_keyval_split_active:w
21627 \s__keyval_mark \s__keyval_tail
21628 \s__keyval_nil \s__keyval_mark
21629 \_keyval_split_active_auxi:w
21630 #2 \s__keyval_mark \_keyval_clean_up_active:w
21631 { \_keyval_loop_active:nnw }
21632 \cs_new:Npn \_keyval_end_loop_active:w
21633 \s__keyval_tail
21634 \_keyval_loop_other:nnw ##1 \s__keyval_mark \s__keyval_tail , \s__keyval_tail ,
21635 { }

```

(End of definition for _keyval_end_loop_other:w and _keyval_end_loop_active:w.)

The parsing loops are done, so here ends the definition of _keyval_tmp:w, which will finally set up the macros.

```

21636 }
21637 \char_set_catcode_active:n { '\, }
21638 \char_set_catcode_active:n { '\= }
21639 \_keyval_tmp:w , =
21640 \group_end:
21641 \cs_generate_variant:Nn \keyval_parse:NNn { NNv , NNv }
21642 \cs_generate_variant:Nn \keyval_parse:nnn { nnV , nnv }

```

_keyval_pair:nnnn
 _keyval_key:nn

These macros will be called on the parsed keys and values of the key–value list. All arguments are completely trimmed. They test for blank key names and call the func-

tions passed to `\keyval_parse:nnn` inside of `\exp_not:n` with the correct arguments. Afterwards they insert the next iteration of the other loop.

```

21643 \group_begin:
21644   \cs_set_protected:Npn \__keyval_tmp:w #1#2
21645   {
21646     \cs_new:Npn \__keyval_pair:nnnn ##1 ##2 ##3 ##4
21647     {
21648       \__keyval_if_blank:w \s__keyval_mark ##2 \s__keyval_nil \s__keyval_stop \__keyval
21649       \s__keyval_mark \s__keyval_stop
21650       #1
21651       \exp_not:n { ##4 {##2} {##1} }
21652       #2
21653       \__keyval_loop_other:nnw {##3} {##4}
21654     }
21655     \cs_new:Npn \__keyval_key:nn ##1 ##2
21656     {
21657       \__keyval_if_blank:w \s__keyval_mark ##1 \s__keyval_nil \s__keyval_stop \__keyval
21658       \s__keyval_mark \s__keyval_stop
21659       #1
21660       \exp_not:n { ##2 {##1} }
21661       #2
21662       \__keyval_loop_other:nnw {##2}
21663     }
21664   }
21665   \__keyval_tmp:w { } { }
21666 \group_end:

```

(End of definition for `__keyval_pair:nnnn` and `__keyval_key:nn`.)

`__keyval_if_empty:w` All these tests work by gobbling tokens until a certain combination is met, which makes them pretty fast. The test for a blank argument should be called with an arbitrary token following the argument. Each of these utilize the fact that the argument will contain a leading `\s__keyval_mark`.

```

21667 \cs_new:Npn \__keyval_if_empty:w #1 \s__keyval_mark \s__keyval_stop { }
21668 \cs_new:Npn \__keyval_if_blank:w \s__keyval_mark #1 { \__keyval_if_empty:w \s__keyval_mark
21669 \cs_new:Npn \__keyval_if_recursion_tail:w \s__keyval_mark #1 \s__keyval_tail { }

```

(End of definition for `__keyval_if_empty:w`, `__keyval_if_blank:w`, and `__keyval_if_recursion_tail:w`.)

`__keyval_blank_true:w` These macros will be called if the tests above didn't gobble them, they execute the branching.

```

\__keyval_blank_key_error:w
21670 \cs_new:Npn \__keyval_blank_true:w \s__keyval_mark \s__keyval_stop \__keyval_trim:nN #1 \__
21671 { \__keyval_loop_other:nnw }
21672 \cs_new:Npn \__keyval_blank_key_error:w \s__keyval_mark \s__keyval_stop #1 \__keyval_loop_o
21673 {
21674   \bool_if:NTF \l__kernel_keyval_allow_blank_keys_bool
21675   { #1 }
21676   { \msg_expandable_error:nn { keyval } { blank-key-name } }
21677   \__keyval_loop_other:nnw
21678 }

```

(End of definition for `__keyval_blank_true:w` and `__keyval_blank_key_error:w`.)

Two messages for the low level parsing system.

```

21679 \msg_new:nnn { keyval } { misplaced-equals-sign }
21680 { Misplaced~'='~in~key-value-input~\msg_line_context: }
21681 \msg_new:nnn { keyval } { blank-key-name }
21682 { Blank~key~name~in~key-value-input~\msg_line_context: }
21683 \prop_gput:Nnn \g_msg_module_name_prop { keyval } { LaTeX }
21684 \prop_gput:Nnn \g_msg_module_type_prop { keyval } { }

```

`__keyval_trim:nN` And an adapted version of `__tl_trim_spaces:nn` which is a bit faster for our use case, as it can strip the braces at the end. This is pretty much the same concept, so I won't comment on it here. The speed gain by using this instead of `tl_trim_spaces_apply:nN` is about 10 % of the total time for `keyval_parse:NNn` with one key and one key–value pair, so I think it's worth it.

```

21685 \group_begin:
21686   \cs_set_protected:Npn __keyval_tmp:w #1
21687   {
21688     \cs_new:Npn __keyval_trim:nN ##1
21689     {
21690       __keyval_trim_auxi:w
21691       ##1
21692       \s_keyval_nil

21715       ##1 \s_keyval_nil
21716       __keyval_trim_auxiii:w
21717     }

```

This is the one macro which differs from the original definition.

```

21718   \cs_new:Npn __keyval_trim_auxiv:w
21719   \s_keyval_mark ##1 \s_keyval_nil
21720   __keyval_trim_auxiii:w \s_keyval_nil __keyval_trim_auxiii:w
21721   ##2
21722   { ##2 { ##1 } }
21723 }
21724 __keyval_tmp:w { ~ }

```

21725 \group_end:

(End of definition for __keyval_trim:nN and others.)

68.2 Constants and variables

21726 <@@=keys>

Various storage areas for the different data which make up keys.

\c__keys_code_root_str	21727	\str_const:Nn \c__keys_code_root_str	{ key~code~>~ }
\c__keys_check_root_str	21728	\str_const:Nn \c__keys_check_root_str	{ key~check~>~ }
\c__keys_default_root_str	21729	\str_const:Nn \c__keys_default_root_str	{ key~default~>~ }
\c__keys_groups_root_str	21730	\str_const:Nn \c__keys_groups_root_str	{ key~groups~>~ }
\c__keys_inherit_root_str	21731	\str_const:Nn \c__keys_inherit_root_str	{ key~inherit~>~ }
\c__keys_type_root_str	21732	\str_const:Nn \c__keys_type_root_str	{ key~type~>~ }

(End of definition for \c__keys_code_root_str and others.)

\c__keys_props_root_str The prefix for storing properties.

21733 \str_const:Nn \c__keys_props_root_str { key~prop~>~ }

(End of definition for \c__keys_props_root_str.)

\l_keys_choice_int Publicly accessible data on which choice is being used when several are generated as a set.

\l_keys_choice_tl

21734 \int_new:N \l_keys_choice_int

21735 \tl_new:N \l_keys_choice_tl

(End of definition for \l_keys_choice_int and \l_keys_choice_tl. These variables are documented on page 252.)

\l__keys_groups_clist Used for storing and recovering the list of groups which apply to a key: set as a comma list but at one point we have to use this for a token list recovery.

21736 \clist_new:N \l__keys_groups_clist

(End of definition for \l__keys_groups_clist.)

\l__keys_inherit_bool For inheritance, particularly for recursion.

21737 \bool_new:N \l__keys_inherit_bool

(End of definition for \l__keys_inherit_bool.)

\l__keys_inherit_clist For normalisation.

21738 \clist_new:N \l__keys_inherit_clist

(End of definition for \l__keys_inherit_clist.)

\l_keys_key_str The name of a key itself: needed when setting keys.

21739 \str_new:N \l_keys_key_str

(End of definition for \l_keys_key_str. This variable is documented on page 255.)

\l_keys_key_tl The tl version is deprecated but has to be handled manually.

21740 \tl_new:N \l_keys_key_tl

(End of definition for \l_keys_key_tl.)

`\l__keys_module_str` The module for an entire set of keys.
21741 `\str_new:N \l__keys_module_str`
(End of definition for \l__keys_module_str.)

`\l__keys_no_value_bool` A marker is needed internally to show if only a key or a key plus a value was seen: this is recorded here.
21742 `\bool_new:N \l__keys_no_value_bool`
(End of definition for \l__keys_no_value_bool.)

`\l__keys_only_known_bool` Used to track if only “known” keys are being set.
21743 `\bool_new:N \l__keys_only_known_bool`
(End of definition for \l__keys_only_known_bool.)

`\l_keys_path_str` The “path” of the current key is stored here: this is available to the programmer and so is public.
21744 `\str_new:N \l_keys_path_str`
(End of definition for \l_keys_path_str. This variable is documented on page 255.)

`\l_keys_path_tl` The older version is deprecated but has to be handled manually.
21745 `\tl_new:N \l_keys_path_tl`
(End of definition for \l_keys_path_tl.)

`\l__keys_inherit_str`
21746 `\str_new:N \l__keys_inherit_str`
(End of definition for \l__keys_inherit_str.)

`\l__keys_relative_tl` The relative path for passing keys back to the user. As this can be explicitly no-value, it must be a token list.
21747 `\tl_new:N \l__keys_relative_tl`
21748 `\tl_set:Nn \l__keys_relative_tl { \q__keys_no_value }`
(End of definition for \l__keys_relative_tl.)

`\l__keys_property_str` The “property” begin set for a key at definition time is stored here.
21749 `\str_new:N \l__keys_property_str`
(End of definition for \l__keys_property_str.)

`\l__keys_selective_bool` Two booleans for using key groups: one to indicate that “selective” setting is active, a
`\l__keys_exclude_bool` second to specify which type (“opt-in” or “opt-out”).
21750 `\bool_new:N \l__keys_selective_bool`
21751 `\bool_new:N \l__keys_exclude_bool`
(End of definition for \l__keys_selective_bool and \l__keys_exclude_bool.)

`\l__keys_selective_clist` The list of key groups being filtered in or out during selective setting.
21752 `\clist_new:N \l__keys_selective_clist`
(End of definition for \l__keys_selective_clist.)

`\l__keys_tmp_clist` Scratch space used as a data dump.

21753 `\clist_new:N \l__keys_tmp_clist`

(End of definition for `\l__keys_tmp_clist`.)

`\l__keys_unused_clist` Used when setting only some keys to store those left over.

21754 `\clist_new:N \l__keys_unused_clist`

(End of definition for `\l__keys_unused_clist`.)

`\l_keys_value_tl` The value given for a key: may be empty if no value was given.

21755 `\tl_new:N \l_keys_value_tl`

(End of definition for `\l_keys_value_tl`. This variable is documented on page 255.)

`\l__keys_tmp_bool` Scratch space.

`\l__keys_tmpa_tl` 21756 `\bool_new:N \l__keys_tmp_bool`

`\l__keys_tmpb_tl` 21757 `\tl_new:N \l__keys_tmpa_tl`

21758 `\tl_new:N \l__keys_tmpb_tl`

(End of definition for `\l__keys_tmp_bool`, `\l__keys_tmpa_tl`, and `\l__keys_tmpb_tl`.)

`\l__keys_precompile_bool` For digesting keys.

`\l__keys_precompile_tl` 21759 `\bool_new:N \l__keys_precompile_bool`

21760 `\tl_new:N \l__keys_precompile_tl`

(End of definition for `\l__keys_precompile_bool` and `\l__keys_precompile_tl`.)

`\l_keys_usage_load_prop` Global data for document-level information.

`\l_keys_usage_preamble_prop` 21761 `\prop_new:N \l_keys_usage_load_prop`

21762 `\prop_new:N \l_keys_usage_preamble_prop`

(End of definition for `\l_keys_usage_load_prop` and `\l_keys_usage_preamble_prop`. These variables are documented on page 254.)

68.2.1 Internal auxiliaries

`\s__keys_nil` Internal scan marks.

`\s__keys_mark` 21763 `\scan_new:N \s__keys_nil`

`\s__keys_stop` 21764 `\scan_new:N \s__keys_mark`

21765 `\scan_new:N \s__keys_stop`

(End of definition for `\s__keys_nil`, `\s__keys_mark`, and `\s__keys_stop`.)

`\q__keys_no_value` Internal quarks.

21766 `\quark_new:N \q__keys_no_value`

(End of definition for `\q__keys_no_value`.)

`__keys_quark_if_no_value_p:N` Branching quark conditional.

`__keys_quark_if_no_value:NTF` 21767 `__kernel_quark_new_conditional:Nn __keys_quark_if_no_value:N { TF }`

(End of definition for `__keys_quark_if_no_value:NTF`.)

```

\__keys_precompile:n An auxiliary to allow cleaner showing of code.
21768 \cs_new_protected:Npn \__keys_precompile:n #1
21769 {
21770     \bool_if:NTF \l__keys_precompile_bool
21771     { \tl_put_right:Nn \l__keys_precompile_tl }
21772     { \use:n }
21773     {#1}
21774 }

```

(End of definition for __keys_precompile:n.)

__keys_cs_undefine:c Local version of \cs_undefine:c to avoid sprinkling \tex_undefined:D everywhere.

```

21775 \cs_new_protected:Npn \__keys_cs_undefine:c #1
21776 {
21777     \if_cs_exist:w #1 \cs_end:
21778     \else:
21779         \use_i:nnnn
21780     \fi:
21781     \cs_set_eq:cN {#1} \tex_undefined:D
21782 }

```

(End of definition for __keys_cs_undefine:c.)

68.3 The key defining mechanism

\keys_define:nn The public function for definitions is just a wrapper for the lower level mechanism, more or less. The outer function is designed to keep a track of the current module, to allow safe nesting. The module is set removing any leading / (which is not needed here).

\keys_define:ne
\keys_define:nx

```

21783 \cs_new_protected:Npn \keys_define:nn #1#2
21784 {
21785     \use:e
21786     {
21787         \exp_not:n
21788         {
21789             \str_set:Nc \l__keys_module_str { \__keys_trim_spaces:n {#1} }
21790             \keyval_parse:NNn \__keys_define:n \__keys_define:nn {#2}
21791         }
21792         \__keys_reset_var:N \l__keys_module_str
21793         \__keys_reset_var:N \l__keys_inherit_str
21794         \__keys_reset_var:N \l_keys_choice_tl
21795         \__keys_reset_var:N \l_keys_key_tl
21796         \__keys_reset_var:N \l_keys_key_str
21797         \__keys_reset_var:N \l_keys_path_tl
21798         \__keys_reset_var:N \l_keys_path_str
21799         \__keys_reset_var:N \l_keys_value_tl
21800         \int_set:Nn \l_keys_choice_int { \int_use:N \l_keys_choice_int }
21801     }
21802 }
21803 \cs_generate_variant:Nn \keys_define:nn { ne , nx }

```

(End of definition for \keys_define:nn. This function is documented on page 246.)

`__keys_define:n` The outer functions here record whether a value was given and then converge on a
`__keys_define:nn` common internal mechanism. There is first a search for a property in the current key
`__keys_define_aux:nn` name, then a check to make sure it is known before the code hands off to the next step.

```

21804 \cs_new_protected:Npn \__keys_define:n #1
21805 {
21806   \bool_set_true:N \l__keys_no_value_bool
21807   \__keys_define_aux:nn {#1} { }
21808 }
21809 \cs_new_protected:Npn \__keys_define:nn #1#2
21810 {
21811   \bool_set_false:N \l__keys_no_value_bool
21812   \__keys_define_aux:nn {#1} {#2}
21813 }
21814 \cs_new_protected:Npn \__keys_define_aux:nn #1#2
21815 {
21816   \__keys_property_find:n {#1}
21817   \cs_if_exist:cTF { \c__keys_props_root_str \l__keys_property_str }
21818   { \__keys_define_code:n {#2} }
21819   {
21820     \str_if_empty:NF \l__keys_property_str
21821     {
21822       \msg_error:nnee { keys } { property-unknown }
21823       \l__keys_property_str \l_keys_path_str
21824     }
21825   }
21826 }

```

(End of definition for `__keys_define:n`, `__keys_define:nn`, and `__keys_define_aux:nn`.)

`__keys_property_find:n` Searching for a property means finding the last . in the input, and storing the text before
`__keys_property_find_auxi:w` and after it. Everything is first turned into strings, so there is no problem using `\cs_`
`__keys_property_find_auxii:w` `set_nopar:Npe` instead of `\str_set:N` to set `\l_keys_path_str`. To gain further speed,
`__keys_property_find_auxiii:w` brace tricks are used and `__keys_property_find_auxiv:w` is defined as expandable.
`__keys_property_find_auxiv:w` Since spaces will already be trimmed from the module we can omit it from the argument
`__keys_property_find_err:w` to `__keys_trim_spaces:n`.

```

21827 \cs_new_protected:Npn \__keys_property_find:n #1
21828 {
21829   \exp_after:wN \__keys_property_find_auxi:w \tl_to_str:n {#1}
21830   \s__keys_nil \__keys_property_find_auxii:w
21831   . \s__keys_nil \__keys_property_find_err:w
21832 }

```

(End of definition for `__keys_legacy_if_set:nn`, `__keys_legacy_if_inverse:nn`, and `__keys_legacy_if_inverse:nnnn`.)

`__keys_meta_make:n` To create a meta-key, simply set up to pass data through. The internal function is used here as a meta key should respect the prevailing filtering, etc.

```

22067 \cs_new_protected:Npn \__keys_meta_make:n
22068 { \exp_args:NV \__keys_meta_make:nn \l_keys_module_str }
22069 \cs_new_protected:Npn \__keys_meta_make:nn #1#2
22070 {
22071     \exp_args:NV \__keys_cmd_set_direct:nn
22072     \l_keys_path_str { \__keys_set:nn {#1} {#2} }
22073 }

```

(End of definition for `__keys_meta_make:n` and `__keys_meta_make:nn`.)

`__keys_prop_put:Nn` Much the same as other variables, but needs a dedicated auxiliary.

```

22074 \cs_new_protected:Npn \__keys_prop_put:Nn #1#2
22075 {
22076     \prop_if_exist:NF #1 { \prop_new:N #1 }
22077     \exp_after:wN \__keys_find_key_module:wNN \l_keys_path_str \s__keys_stop
22078     \l_keys_tmpa_tl \l_keys_tmpb_tl
22079     \__keys_cmd_set:ne \l_keys_path_str
22080     {
22081         \exp_not:c { prop_ #2 put:Nnn }
22082         \exp_not:N #1
22083         { \l_keys_tmpb_tl }
22084         \exp_not:n { {##1} }
22085     }
22086 }
22087 \cs_generate_variant:Nn \__keys_prop_put:Nn { c }

```

(End of definition for `__keys_prop_put:Nn`.)

`__keys_undefine:` Undefined a key has to be done without `\cs_undefine:c` as that function acts globally.

```

22088 \cs_new_protected:Npn \__keys_undefine:
22089 {
22090     \clist_map_inline:nn
22091     { code , default , groups , inherit , type , check }
22092     {
22093         \__keys_cs_undefine:c

```

```

22094         { \tl_use:c { c__keys_ ##1 _root_str } \l_keys_path_str }
22095     }
22096 }

```

(End of definition for __keys_undefine:.)

__keys_value_requirement:nn Validating key input is done using a second function which runs before the main key code. Setting that up means setting it equal to a generic stub which does the check. This approach makes the lookup very fast at the cost of one additional csname per key that needs it. The cleanup here has to know the structure of the following code.

```

22097 \cs_new_protected:Npn \__keys_value_requirement:nn #1#2
22098 {
22099     \str_case:nnF {#2}
22100     {
22101         { true }
22102         {
22103             \cs_set_eq:cc

(End of definition for `__keys_variable_set:NnnN` and `__keys_variable_set_required:NnnN`.)

68.5 Creating key properties

The key property functions are all wrappers for internal functions, meaning that things stay readable and can also be altered later on.

Importantly, while key properties have “normal” argument specs, the underlying code always supplies one braced argument to these. As such, argument expansion is handled by hand rather than using the standard tools. This shows up particularly for the two-argument properties, where things would otherwise go badly wrong.

```

.bool_set:N One function for this.
.bool_set:c 22215 \cs_new_protected:cpn { \c__keys_props_root_str .bool_set:N } #1
                { \__keys_bool_set:Nn #1 { } }
.bool_gset:N 22216 { \__keys_bool_set:Nn #1 { } }
.bool_gset:c 22217 \cs_new_protected:cpn { \c__keys_props_root_str .bool_gset:c } #1
                { \__keys_bool_set:cn {#1} { } }
                22218 { \__keys_bool_set:cn {#1} { } }
                22219 \cs_new_protected:cpn { \c__keys_props_root_str .bool_gset:N } #1
                { \__keys_bool_set:Nn #1 { g } }
                22220 { \__keys_bool_set:Nn #1 { g } }
                22221 \cs_new_protected:cpn { \c__keys_props_root_str .bool_gset:c } #1
                { \__keys_bool_set:cn {#1} { g } }
                22222 { \__keys_bool_set:cn {#1} { g } }

```

(End of definition for `.bool_set:N` and `.bool_gset:N`. These functions are documented on page 247.)

```

.bool_set_inverse:N One function for this.
.bool_set_inverse:c 22223 \cs_new_protected:cpn { \c__keys_props_root_str .bool_set_inverse:N } #1
.bool_gset_inverse:N 22224 { \__keys_bool_set_inverse:Nn #1 { } }
.bool_gset_inverse:c 22225 \cs_new_protected:cpn { \c__keys_props_root_str .bool_set_inverse:c } #1
22226 { \__keys_bool_set_inverse:cn {#1} { } }
22227 \cs_new_protected:cpn { \c__keys_props_root_str .bool_gset_inverse:N } #1
22228 { \__keys_bool_set_inverse:Nn #1 { g } }
22229 \cs_new_protected:cpn { \c__keys_props_root_str .bool_gset_inverse:c } #1
22230 { \__keys_bool_set_inverse:cn {#1} { g } }

```

(End of definition for `.bool_set_inverse:N` and `.bool_gset_inverse:N`. These functions are documented on page 247.)

.choice: Making a choice is handled internally, as it is also needed by `.generate_choices:n`.

```

22231 \cs_new_protected:cpn { \c__keys_props_root_str .choice: }
22232 { \__keys_choice_make: }

```

(End of definition for `.choice:`. This function is documented on page 247.)

.choices:nn For auto-generation of a series of mutually-exclusive choices. Here, `#1` consists of two separate arguments, hence the slightly odd-looking implementation.

```

.choices:Vn 22233 \cs_new_protected:cpn { \c__keys_props_root_str .choices:nn } #1
.choices:en 22234 { \__keys_choices_make:nn #1 }
.choices:on 22235 \cs_new_protected:cpn { \c__keys_props_root_str .choices:Vn } #1
.choices:xn 22236 { \exp_args:NV \__keys_choices_make:nn #1 }
22237 \cs_new_protected:cpn { \c__keys_props_root_str .choices:en } #1
22238 { \exp_args:Ne \__keys_choices_make:nn #1 }
22239 \cs_new_protected:cpn { \c__keys_props_root_str .choices:on } #1
22240 { \exp_args:No \__keys_choices_make:nn #1 }
22241 \cs_new_protected:cpn { \c__keys_props_root_str .choices:xn } #1
22242 { \exp_args:Nx \__keys_choices_make:nn #1 }

```

(End of definition for `.choices:nn`. This function is documented on page 247.)

.code:n Creating code is simply a case of passing through to the underlying set function.

```

22243 \cs_new_protected:cpn { \c__keys_props_root_str .code:n } #1
22244 { \__keys_cmd_set:nn \l_keys_path_str {#1} }

```

(End of definition for `.code:n`. This function is documented on page 248.)

```

.clist_set:N 22245 \cs_new_protected:cpn { \c__keys_props_root_str .clist_set:N } #1
.clist_set:c 22246 { \__keys_variable_set:NnnN #1 { clist } { } n }
.clist_gset:N 22247 \cs_new_protected:cpn { \c__keys_props_root_str .clist_set:c } #1
.clist_gset:c 22248 { \__keys_variable_set:cnnN {#1} { clist } { } n }
22249 \cs_new_protected:cpn { \c__keys_props_root_str .clist_gset:N } #1
22250 { \__keys_variable_set:NnnN #1 { clist } { g } n }
22251 \cs_new_protected:cpn { \c__keys_props_root_str .clist_gset:c } #1
22252 { \__keys_variable_set:cnnN {#1} { clist } { g } n }

```

(End of definition for `.clist_set:N` and `.clist_gset:N`. These functions are documented on page 247.)

```

.cs_set:Np
.cs_set:cp 22253 \cs_new_protected:cpn { \c__keys_props_root_str .cs_set:Np } #1
.cs_set_protected:Np 22254 { \__keys_cs_set:NNpn \cs_set:Npn #1 { } }
.cs_set_protected:cp 22255 \cs_new_protected:cpn { \c__keys_props_root_str .cs_set:cp } #1

22264 { \__keys_cs_set:Ncpn \cs_gset:Npn #1 { } }
22265 \cs_new_protected:cpn { \c__keys_props_root_str .cs_gset_protected:Np } #1
22266 { \__keys_cs_set:NNpn \cs_gset_protected:Npn #1 { } }
22267 \cs_new_protected:cpn { \c__keys_props_root_str .cs_gset_protected:cp } #1
22268 { \__keys_cs_set:Ncpn \cs_gset_protected:Npn #1 { } }

```

(End of definition for .cs_set:Np and others. These functions are documented on page 248.)

```

.default:n Expansion is left to the internal functions.
.default:V 22269 \cs_new_protected:cpn { \c__keys_props_root_str .default:n } #1
.default:e 22270 { \__keys_default_set:n {#1} }
.default:o 22271 \cs_new_protected:cpn { \c__keys_props_root_str .default:V } #1
.default:x 22272 { \exp_args:NV \__keys_default_set:n #1 }
22273 \cs_new_protected:cpn { \c__keys_props_root_str .default:e } #1
22274 { \exp_args:Ne \__keys_default_set:n {#1} }
22275 \cs_new_protected:cpn { \c__keys_props_root_str .default:o } #1
22276 { \exp_args:No \__keys_default_set:n {#1} }
22277 \cs_new_protected:cpn { \c__keys_props_root_str .default:x } #1
22278 { \exp_args:Nx \__keys_default_set:n {#1} }

```

(End of definition for .default:n. This function is documented on page 248.)

```

.dim_set:N Setting a variable is very easy: just pass the data along.
.dim_set:c 22279 \cs_new_protected:cpn { \c__keys_props_root_str .dim_set:N } #1
.dim_gset:N 22280 { \__keys_variable_set_required:NnnN #1 { dim } { } n }
.dim_gset:c 22281 \cs_new_protected:cpn { \c__keys_props_root_str .dim_set:c } #1
22282 { \__keys_variable_set_required:cnnN {#1} { dim } { } n }
22283 \cs_new_protected:cpn { \c__keys_props_root_str .dim_gset:N } #1
22284 { \__keys_variable_set_required:NnnN #1 { dim } { g } n }
22285 \cs_new_protected:cpn { \c__keys_props_root_str .dim_gset:c } #1
22286 { \__keys_variable_set_required:cnnN {#1} { dim } { g } n }

```

(End of definition for .dim_set:N and .dim_gset:N. These functions are documented on page 248.)

```

.fp_set:N Setting a variable is very easy: just pass the data along.
.fp_set:c 22287 \cs_new_protected:cpn { \c__keys_props_root_str .fp_set:N } #1
.fp_gset:N 22288 { \__keys_variable_set_required:NnnN #1 { fp } { } n }
.fp_gset:c 22289 \cs_new_protected:cpn { \c__keys_props_root_str .fp_set:c } #1
22290 { \__keys_variable_set_required:cnnN {#1} { fp } { } n }
22291 \cs_new_protected:cpn { \c__keys_props_root_str .fp_gset:N } #1
22292 { \__keys_variable_set_required:NnnN #1 { fp } { g } n }
22293 \cs_new_protected:cpn { \c__keys_props_root_str .fp_gset:c } #1
22294 { \__keys_variable_set_required:cnnN {#1} { fp } { g } n }

```

(End of definition for `.fp_set:N` and `.fp_gset:N`. These functions are documented on page 248.)

.groups:n A single property to create groups of keys.

```
22295 \cs_new_protected:cpn { \c__keys_props_root_str .groups:n } #1
22296 { \__keys_groups_set:n {#1} }
```

(End of definition for `.groups:n`. This function is documented on page 249.)

.inherit:n Nothing complex: only one variant at the moment!

```
22297 \cs_new_protected:cpn { \c__keys_props_root_str .inherit:n } #1
22298 { \__keys_inherit:n {#1} }
```

(End of definition for `.inherit:n`. This function is documented on page 249.)

.initial:n The standard hand-off approach.

```
.initial:V 22299 \cs_new_protected:cpn { \c__keys_props_root_str .initial:n } #1
.initial:e 22300 { \__keys_initialise:n {#1} }
.initial:o 22301 \cs_new_protected:cpn { \c__keys_props_root_str .initial:V } #1
.initial:x 22302 { \exp_args:NV \__keys_initialise:n #1 }
22303 \cs_new_protected:cpn { \c__keys_props_root_str .initial:e } #1
22304 { \exp_args:Ne \__keys_initialise:n {#1} }
22305 \cs_new_protected:cpn { \c__keys_props_root_str .initial:o } #1
22306 { \exp_args:No \__keys_initialise:n {#1} }
22307 \cs_new_protected:cpn { \c__keys_props_root_str .initial:x } #1
22308 { \exp_args:Nx \__keys_initialise:n {#1} }
```

(End of definition for `.initial:n`. This function is documented on page 249.)

.int_set:N Setting a variable is very easy: just pass the data along.

```
.int_set:c 22309 \cs_new_protected:cpn { \c__keys_props_root_str .int_set:N } #1
.int_gset:N 22310 { \__keys_variable_set_required:NnnN #1 { int } { } n }
.int_gset:c 22311 \cs_new_protected:cpn { \c__keys_props_root_str .int_set:c } #1
22312 { \__keys_variable_set_required:cnnN {#1} { int } { } n }
22313 \cs_new_protected:cpn { \c__keys_props_root_str .int_gset:N } #1
22314 { \__keys_variable_set_required:NnnN #1 { int } { g } n }
22315 \cs_new_protected:cpn { \c__keys_props_root_str .int_gset:c } #1
22316 { \__keys_variable_set_required:cnnN {#1} { int } { g } n }
```

(End of definition for `.int_set:N` and `.int_gset:N`. These functions are documented on page 249.)

```
.legacy_if_set:n
.legacy_if_gset:n 22317 \cs_new_protected:cpn { \c__keys_props_root_str .legacy_if_set:n } #1
.legacy_if_set_inverse:n 22318 { \__keys_legacy_if_set:nn {#1} { } }
.legacy_if_gset_inverse:n 22319 \cs_new_protected:cpn { \c__keys_props_root_str .legacy_if_gset:n } #1
22320 { \__keys_legacy_if_set:nn {#1} { g } }
22321 \cs_new_protected:cpn { \c__keys_props_root_str .legacy_if_set_inverse:n } #1
22322 { \__keys_legacy_if_set_inverse:nn {#1} { } }
22323 \cs_new_protected:cpn { \c__keys_props_root_str .legacy_if_gset_inverse:n } #1
22324 { \__keys_legacy_if_set_inverse:nn {#1} { g } }
```

(End of definition for `.legacy_if_set:n` and others. These functions are documented on page 249.)

.meta:n Making a meta is handled internally.

```
22325 \cs_new_protected:cpn { \c__keys_props_root_str .meta:n } #1
22326 { \__keys_meta_make:n {#1} }
```

(End of definition for `.meta:n`. This function is documented on page 249.)

.meta:nn Meta with path: potentially lots of variants, but for the moment no so many defined.

```
22327 \cs_new_protected:cpn { \c__keys_props_root_str .meta:nn } #1
22328 { \__keys_meta_make:nn #1 }
```

(End of definition for `.meta:nn`. This function is documented on page 250.)

.multichoice: The same idea as `.choice:` and `.choices:nn`, but where more than one choice is allowed.

```
.multichoices:nn 22329 \cs_new_protected:cpn { \c__keys_props_root_str .multichoice: }
                22330 { \__keys_multichoice_make: }
.multichoices:Vn 22331 \cs_new_protected:cpn { \c__keys_props_root_str .multichoices:nn } #1
                22332 { \__keys_multichoices_make:nn #1 }
.multichoices:en 22333 \cs_new_protected:cpn { \c__keys_props_root_str .multichoices:Vn } #1
                22334 { \exp_args:NV \__keys_multichoices_make:nn #1 }
.multichoices:on 22335 \cs_new_protected:cpn { \c__keys_props_root_str .multichoices:en } #1
                22336 { \exp_args:Ne \__keys_multichoices_make:nn #1 }

22404 { \__keys_value_requirement:nn { required } {#1} }
```

(End of definition for `.value_forbidden:n` and `.value_required:n`. These functions are documented on page 251.)

68.6 Setting keys

```
\__keys_set:nnnnNn
\__keys_reset_bool:N
\__keys_reset_var:N
  \__keys_set:nn
  \__keys_set:nnn
```

The aim here is to allow nesting of key setting without needing lots of tracking. That is done by expanding the appropriate tokens “around” the core keyval parsing. As there are several different sub-paths, this needs a few steps and some generic auxiliaries. The arguments here are

1. The root for keys
2. The key groups
3. The keys themselves
4. The relative root for return of unset keys
5. The `clist` var for returning unset keys
6. The code to set up the correct selection approach

```
22405 \cs_new_protected:Npn \__keys_set:nnnnNn #1#2#3#4#5#6
22406 {
22407   \use:e
22408   {
22409     \exp_not:n

```

(End of definition for \keys_set_exclude_groups:nnnN and others. These functions are documented on page 257.)

\keys_precompile:nnN A simple wrapper.

```

22522 \cs_new_protected:Npn \keys_precompile:nnN #1#2#3
22523 {
22524   \bool_set_true:N \l__keys_precompile_bool
22525   \tl_clear:N \l__keys_precompile_tl
22526   \keys_set:nn {#1} {#2}
22527   \bool_set_false:N \l__keys_precompile_bool
22528   \tl_set_eq:NN #3 \l__keys_precompile_tl
22529 }

```

(End of definition for \keys_precompile:nnN. This function is documented on page 257.)

```

\__keys_set_keyval:n A shared system once again. First, set the current path and add a default if needed.
\__keys_set_keyval:nn There are then checks to see if a value is required or forbidden. If everything passes,
\__keys_set_keyval:nnn move on to execute the code.
\__keys_set_keyval:onn
\__keys_find_key_module:wNN
\__keys_find_key_module_auxi:Nw
\__keys_find_key_module_auxii:Nw
\__keys_find_key_module_auxiii:Nn
\__keys_find_key_module_auxiv:Nw
\__keys_set_selective:
22530 \cs_new_protected:Npn \__keys_set_keyval:n #1
22531 {
22532   \bool_set_true:N \l__keys_no_value_bool
22533   \__keys_set_keyval:onn \l__keys_module_str {#1} { }
22534 }
22535 \cs_new_protected:Npn \__keys_set_keyval:nn #1#2
22536 {
22537   \bool_set_false:N \l__keys_no_value_bool
22538   \__keys_set_keyval:onn \l__keys_module_str {#1} {#2}
22539 }

```

The key path here can be fully defined, after which there is a search for the key and module names: the user may have passed them with part of what is actually the module (for our purposes) in the key name. As that happens on a per-key basis, we use the stack approach to restore the module name without a group.

```

22540 \cs_new_protected:Npn \__keys_set_keyval:nnn #1#2#3
22541 {
22542   \__kernel_tl_set:Nx \l_keys_path_str

```

If selective setting is active, there are a number of possible sub-cases to consider. The key name may not be known at all or if it is, it may not have any groups assigned. There is then the question of whether the selection is opt-in or opt-out.

```

22586 \cs_new_protected:Npn \__keys_set_selective:
22587 {
22588     \cs_if_exist:cTF { \c__keys_groups_root_str \l_keys_path_str }
22589     {
22590         \clist_set_eq:Nc \l__keys_groups_clist
22591         { \c__keys_groups_root_str \l_keys_path_str }
22592         \__keys_check_groups:
22593     }
22594     {
22595         \bool_if:NTF \l__keys_exclude_bool
22596         \__keys_execute:
22597         \__keys_store_unused:
22598     }
22599 }

```

In the case where selective setting requires a comparison of the list of groups which apply to a key with the list of those which have been set active. That requires two mappings, and again a different outcome depending on whether opt-in or opt-out is set. It is safe to use `\clist_if_in:NnTF` because both `\l__keys_selective_clist` and `\l__keys_groups_clist` contain the groups as strings, without leading/trailing spaces in any item, since the `l3clist` functions were applied to the result of applying `\tl_to_str:n`.

```

22600 \cs_new_protected:Npn \__keys_check_groups:
22601 {
22602     \bool_set_false:N \l__keys_tmp_bool
22603     \clist_map_inline:Nn \l__keys_selective_clist
22604     {
22605         \clist_if_in:NnT \l__keys_groups_clist {##1}

```

```

22606         {
22607             \bool_set_true:N \l__keys_tmp_bool
22608             \clist_map_break:

```

A key's code is in the control sequence with csname `\c__keys_code_root_str #1`. We expand it once to get the replacement text (with argument #2) and call `\use:n` with this replacement as its argument. This ensures that any undefined control sequence error in the key's code will lead to an error message of the form `<argument>...<control sequence>` in which one can read the (undefined) `<control sequence>` in full, rather than an error message that starts with the potentially very long key name, which would make the (undefined) `<control sequence>` be truncated or sometimes completely hidden. See <https://github.com/latex3/latex2e/issues/351>.

```

22736   }
22737 }

```

When there is no relative path, things here are easy: just save the key name and value. When we are working with a relative path, first we need to turn it into a string: that can't happen earlier as we need to store `\q__keys_no_value`. Then, use a standard delimited approach to fish out the partial path.

```

22738 \cs_new_protected:Npn \__keys_store_unused:

```

(End of definition for __keys_execute: and others.)

`__keys_choice_find:n` Executing a choice has two parts. First, try the choice given, then if that fails call the
`__keys_choice_find:nn` unknown key. That always exists, as it is created when a choice is first made. So there
`__keys_multichoice_find:n` is no need for any escape code. For multiple choices, the same code ends up used in a
mapping.

```

22795 \cs_new:Npn \__keys_choice_find:n #1
22796 {
22797   \str_if_empty:NTF \l__keys_inherit_str
22798     { \__keys_choice_find:nn \l_keys_path_str {#1} }
22799     {
22800       \__keys_choice_find:nn
22801       { \l__keys_inherit_str / \l_keys_key_str } {#1}
22802     }
22803 }
22804 \cs_new:Npn \__keys_choice_find:nn #1#2

22829 \cs_new:Npn \__keys_parent_auxiv:w #1 \q_nil \__keys_parent_auxiv:w
22830 {
22831 }

```

(End of definition for `__keys_parent:o` and others.)

`__keys_trim_spaces:n` Space stripping has to allow for the fact that the key here might have several parts, and
`__keys_trim_spaces_auxi:w` spaces need to be stripped from each part. Since the key name is turned into a string
`__keys_trim_spaces_auxii:w`
`__keys_trim_spaces_auxiii:w`

groups can't be stripped accidentally and the precautions of `\tl_trim_spaces:n` aren't necessary, in this case it is much faster to just directly strip spaces around `/`.

```

22832 \group_begin:
22833   \cs_set:Npn \__keys_tmp:w #1
22834     {
22835       \cs_new:Npn \__keys_trim_spaces:n ##1

Chapter 69

l3intarray implementation

23008 <@@=intarray>

23009 <*code>

There are two implementations for this module: One `\fontdimen` based one for more traditional TeX engines and a Lua based one for engines with Lua support.

Both versions do not allow negative array sizes.

23010 \msg_new:nnn { kernel } { negative-array-size }

23011 { Size-of-array-may-not-be-negative:~#1 }

__intarray_sep:

23012 \cs_new_eq:NN __intarray_sep: __kernel_int_sep:

(End of definition for __intarray_sep:.)

\l__intarray_loop_int A loop index.

23013 \int_new:N \l__intarray_loop_int

(End of definition for \l__intarray_loop_int.)

69.1 Lua implementation

First, let's look at the Lua variant:

We select the Lua version if the Lua helpers were defined. This can be detected by the presence of `__intarray_gset_count:Nw`.

23014 \cs_if_exist:NTF __intarray_gset_count:Nw

23015 {

69.1.1 Allocating arrays

\g__intarray_table_int Used to differentiate intarrays in Lua and to record an invalid index.
\l__intarray_bad_index_int

23016 \int_new:N \g__intarray_table_int

23017 \int_new:N \l__intarray_bad_index_int

23018 </code>

(End of definition for \g__intarray_table_int and \l__intarray_bad_index_int.)

`_intarray:w` Used as marker for intarrays in Lua. Followed by an unbraced number identifying the array and a single space. This format is used to make it easy to scan from Lua.

```

23019 (*lua)
23020 luacmd('\_intarray:w', function()
23021     scan_int()
23022     tex.error'LaTeX Error: Isolated intarray ignored'
23023 end, 'protected', 'global')
23024 (/lua)

```

(End of definition for _intarray:w.)

`\intarray_new:Nn` Declare #1 as a tokenlist with the scanmark and a unique number. Pass the array's size to the Lua helper. Every intarray must be global; it's enough to run this check in `\intarray_new:Nn`.

```

23025 (*code)
23026     \cs_new_protected:Npn \_intarray_new:N #1
23027     {
23028         \_kernel_chk_if_free_cs:N #1
23029         \int_gincr:N \g\_intarray_table_int
23030         \cs_gset_nopar:Npe #1 { \_intarray:w \int_use:N \g\_intarray_table_int \c_space_tl
23031     }
23032     \cs_new_protected:Npn \intarray_new:Nn #1#2
23033     {
23034         \_intarray_new:N #1
23035         \_intarray_gset_count:Nw #1 \int_eval:n {#2} \scan_stop:
23036         \int_compare:nNtT { \intarray_count:N #1 } < 0
23037         {
23038             \msg_error:nne { kernel } { negative-array-size }
23039             { \intarray_count:N #1 }
23040         }
23041     }
23042     \cs_generate_variant:Nn \intarray_new:Nn { c }
23043 (/code)

```

(End of definition for \intarray_new:Nn and _intarray_new:N. This function is documented on page 261.)

Before we get to the first command implemented in Lua, we first need some definitions. Since `token.create` only works correctly if `TEX` has seen the tokens before, we first run a short `TEX` sequence to ensure that all relevant control sequences are known.

```

23044 (*lua)
23045
23046 local scan_token = token.scan_token
23047 local put_next = token.put_next
23048 local intarray_marker = token_create_safe'\_intarray:w'
23049 local use_none = token_create_safe'use_none:n'
23050 local use_i = token_create_safe'use:n'
23051 local expand_after_scan_stop = {token_create_safe'exp_after:wN',
23052                                 token_create_safe'scan_stop:'}
23053 local comma = token_create(string.byte',')

```

`_intarray_table` Internal helper to scan an intarray token, extract the associated Lua table and return an error if the input is invalid.

```

23054 local \_intarray_table do

```

```

23055 local tables = get_luadata and get_luadata'__intarray' or {[0] = {}}
23056 function __intarray_table()
23057     local t = scan_token()
23058     if t ~= intarray_marker then
23059         put_next(t)
23060         tex.error'LaTeX Error: intarray expected'
23061         return tables[0]
23062     end
23063     local i = scan_int()
23064     local current_table = tables[i]
23065     if current_table then return current_table end
23066     current_table = {}
23067     tables[i] = current_table
23068     return current_table
23069 end

```

Since in L^AT_EX this is loaded in the format, we want to preserve any intarrays which are created while format building for the actual run.

To do this, we use the `register_luadata` mechanism from l3luatex: Directly before the format get dumped, the following function gets invoked and serializes all existing tables into a string. This string gets compiled and dumped into the format and is made available at the beginning of regular runs as `get_luadata'@@'`.

```

23070 if register_luadata then
23071     register_luadata('__intarray', function()
23072         local t = "{[0]={},"
23073         for i=1, #tables do
23074             t = string.format("%s{%s},"", t, table.concat(tables[i], ','))
23075         end
23076         return t .. "}"
23077     end)
23078 end
23079 end

```

(End of definition for __intarray_table.)

`\intarray_count:N` Set and get the size of an array. “Setting the size” means in this context that we add zeros until we reach the desired size.
`\intarray_count:c`
`__intarray_gset_count:Nw`

```

23080
23081 local sprint = tex.sprint
23082
23083 luacmd('__intarray_gset_count:Nw', function()
23084     local t = __intarray_table()
23085     local n = scan_int()
23086     for i=#t+1, n do t[i] = 0 end
23087 end, 'protected', 'global')
23088
23089 luacmd('intarray_count:N', function()
23090     sprint(-2, #__intarray_table())
23091 end, 'global')
23092 \lua
23093 \code
23094 \cs_generate_variant:Nn \intarray_count:N { c }
23095 \code

```

(End of definition for `\intarray_count:N` and `__intarray_gset_count:Nw`. This function is documented on page 262.)

69.1.2 Array items

`__intarray_gset:wF` The setter provided by Lua. The argument order somewhat emulates the `\fontdimen:`
`__intarray_gset:w` First the array index, followed by the intarray and then the new value. This has been chosen over a more conventional order to provide a delimiter for the numbers.

```

23096 (*lua)
23097 luacmd('\__intarray_gset:wF', function()
23098   local i = scan_int()
23099   local t = __intarray_table()
23100   if t[i] then
23101     t[i] = scan_int()
23102     put_next(use_none)
23103   else
23104     tex.count.l__intarray_bad_index_int = i
23105     scan_int()
23106     put_next(use_i)
23107   end
23108 end, 'protected', 'global')
23109
23110 luacmd('\__intarray_gset:w', function()
23111   local i = scan_int()
23112   local t = __intarray_table()
23113   t[i] = scan_int()
23114 end, 'protected', 'global')
23115 (/lua)

```

(End of definition for `__intarray_gset:wF` and `__intarray_gset:w`.)

`\intarray_gset:Nnn` The `__kernel_intarray_gset:Nnn` function does not use `\int_eval:n`, namely its
`\intarray_gset:cnn` arguments must be suitable for `\int_value:w`. The user version checks the position and
`__kernel_intarray_gset:Nnn` value are within bounds.

```

23116 (*code)
23117   \cs_new_protected:Npn \__kernel_intarray_gset:Nnn #1#2#3
23118     { \__intarray_gset:w #2 #1 #3 \scan_stop: }
23119   \cs_new_protected:Npn \intarray_gset:Nnn #1#2#3
23120     {
23121       \__intarray_gset:wF \int_eval:n {#2} #1 \int_eval:n{#3}
23122       {
23123         \msg_error:nneee { kernel } { out-of-bounds }
23124         { \token_to_str:N #1 } { \int_use:N \l__intarray_bad_index_int } { \intarray_
23125       }
23126     }
23127   \cs_generate_variant:Nn \intarray_gset:Nnn { c }
23128 (/code)

```

(End of definition for `\intarray_gset:Nnn` and `__kernel_intarray_gset:Nnn`. This function is documented on page 262.)

`\intarray_gzero:N` Set the appropriate array entry to zero. No bound checking needed.
`\intarray_gzero:c`

```

23129 (*lua)
23130 luacmd('intarray_gzero:N', function()

```

```

23131 local t = __intarray_table()
23132 for i=1, #t do
23133     t[i] = 0
23134 end
23135 end, 'global', 'protected')
23136 \lua
23137 (*code)
23138 \cs_generate_variant:Nn \intarray_gzero:N { c }
23139 \code

```

(End of definition for `\intarray_gzero:N`. This function is documented on page 261.)

```

\intarray_item:Nn Get the appropriate entry and perform bound checks. The \__kernel_intarray_
\intarray_item:cn item:Nn function omits bound checks and omits \int_eval:n, namely its argument
\__kernel_intarray_item:Nn must be a TEX integer suitable for \int_value:w.
\__intarray_item:wF
\__intarray_item:w
23140 \lua
23141 luacmd('__intarray_item:wF', function()
23142     local i = scan_int()
23143     local t = __intarray_table()
23144     local item = t[i]
23145     if item then
23146         put_next(use_none)
23147     else
23148         tex.l__intarray_bad_index_int = i
23149         put_next(use_i)
23150     end
23151     put_next(expand_after_scan_stop)
23152     scan_token()
23153     if item then
23154         sprint(-2, item)
23155     end
23156 end, 'global')
23157
23158 luacmd('__intarray_item:w', function()
23159     local i = scan_int()
23160     local t = __intarray_table()
23161     sprint(-2, t[i])
23162 end, 'global')
23163 \lua
23164 (*code)
23165 \cs_new:Npn \__kernel_intarray_item:Nn #1#2
23166 { \__intarray_item:w #2 #1 }
23167 \cs_new:Npn \intarray_item:Nn #1#2
23168 {
23169     \__intarray_item:wF \int_eval:n {#2} #1
23170     {
23171         \msg_expandable_error:nnfff { kernel } { out-of-bounds }
23172         { \token_to_str:N #1 } { \int_use:N \l__intarray_bad_index_int } { \intarray_
23173         0
23174     }
23175 }
23176 \cs_generate_variant:Nn \intarray_item:Nn { c }

```

(End of definition for `\intarray_item:Nn` and others. This function is documented on page 262.)

`\intarray_rand_item:N` Importantly, `\intarray_item:Nn` only evaluates its argument once.

```

23177 \cs_new:Npn \intarray_rand_item:N #1
23178 { \intarray_item:Nn #1 { \int_rand:n { \intarray_count:N #1 } } }
23179 \cs_generate_variant:Nn \intarray_rand_item:N { c }

```

(End of definition for `\intarray_rand_item:N`. This function is documented on page 262.)

69.1.3 Working with contents of integer arrays

`\intarray_const_from_clist:Nn` We use the `__kernel_intarray_gset:Nnn` which does not do bounds checking and instead automatically resizes the array. This is not implemented in Lua to ensure that the clist parsing is consistent with the clist module.

```

23180 \cs_new_protected:Npn \intarray_const_from_clist:Nn #1#2
23181 {
23182   \__intarray_new:N #1
23183   \int_zero:N \l__intarray_loop_int
23184   \clist_map_inline:nn {#2}
23185   {
23186     \int_incr:N \l__intarray_loop_int
23187     \__kernel_intarray_gset:Nnn #1 \l__intarray_loop_int { \int_eval:n {##1} } }
23188   }
23189   \cs_generate_variant:Nn \intarray_const_from_clist:Nn { c }

```

(End of definition for `\intarray_const_from_clist:Nn`. This function is documented on page 261.)

`__intarray_to_clist:Nn` The `__intarray_to_clist:Nn` auxiliary allows to choose the delimiter and is also used in `\intarray_show:N`. Here we just pass the information to Lua and let `table.concat` do the actual work. We discard the category codes of the passed delimiter but this is not an issue since the delimiter is always just a comma or a comma and a space. In both cases `sprint(2, ...)` provides the right catcodes.

```

23190 /code
23191 *lua
23192 local concat = table.concat
23193 luacmd('\__intarray_to_clist:Nn', function()
23194   local t = __intarray_table()
23195   local sep = token.scan_string()
23196   sprint(-2, concat(t, sep))
23197 end, 'global')
23198 /lua

```

(End of definition for `__intarray_to_clist:Nn` and `__intarray_to_clist:w`.)

`__kernel_intarray_range_to_clist:Nnn` Loop through part of the array.

```

23199 *code
23200 \cs_new:Npn \__kernel_intarray_range_to_clist:Nnn #1#2#3
23201 {
23202   \__intarray_range_to_clist:w #1
23203   \int_eval:n {#2} ~ \int_eval:n {#3} ~
23204 }
23205 /code
23206 *lua
23207 luacmd('\__intarray_range_to_clist:w', function()
23208   local t = __intarray_table()
23209   local from = scan_int()

```

```

23210   local to = scan_int()
23211   sprint(-2, concat(t, ', ', from, to))
23212 end, 'global')
23213  $\langle$ /lua $\rangle$ 

```

(End of definition for `_kernel_intarray_range_to_clist:Nnn` and `_intarray_range_to_clist:w`.)

`_kernel_intarray_gset_range_from_clist:Nnn`
`_intarray_gset_range:nNw`

Loop through part of the array. We allow additional commas at the end.

```

23214  $\langle$ *code $\rangle$ 
23215   \cs_new_protected:Npn \_kernel_intarray_gset_range_from_clist:Nnn #1#2#3
23216   {
23217     \_intarray_gset_range:w \int_eval:w #2 #1 #3 , , \scan_stop:
23218   }
23219  $\langle$ /code $\rangle$ 
23220  $\langle$ *lua $\rangle$ 
23221 luacmd('\_intarray_gset_range:w', function()
23222   local from = scan_int()
23223   local t = \_intarray_table()
23224   while true do
23225     local tok = scan_token()
23226     if tok == comma then
23227       repeat
23228         tok = scan_token()
23229       until tok ~= comma
23230       break
23231     else
23232       put_next(tok)
23233     end
23234     t[from] = scan_int()
23235     scan_token()
23236     from = from + 1
23237   end
23238 end, 'global', 'protected')
23239  $\langle$ /lua $\rangle$ 

```

(End of definition for `_kernel_intarray_gset_range_from_clist:Nnn` and `_intarray_gset_range:nNw`.)

`_intarray_gset_overflow_test:nw`

In order to allow some code sharing later we provide the `_intarray_gset_overflow_test:nw` name here. It doesn't actually test anything since the Lua implementation accepts all integers which could be tested with `\tex_ifabsnum:D`.

```

23240  $\langle$ *code $\rangle$ 
23241   \cs_new_protected:Npn \_intarray_gset_overflow_test:nw #1
23242   {
23243   }

```

(End of definition for `_intarray_gset_overflow_test:nw`.)

69.2 Font dimension based implementation

Go to the false branch of the conditional above.

```

23244   }
23245   {

```

69.2.1 Allocating arrays

<code>__intarray_entry:w</code>	We use these primitives quite a lot in this module.
<code>__intarray_count:w</code>	<pre> 23246 \cs_new_eq:NN __intarray_entry:w \tex_fontdimen:D 23247 \cs_new_eq:NN __intarray_count:w \tex_hyphenchar:D </pre> <p>(End of definition for <code>__intarray_entry:w</code> and <code>__intarray_count:w</code>.)</p>
<code>\c__intarray_sp_dim</code>	Used to convert integers to dimensions fast. <pre> 23248 \dim_const:Nn \c__intarray_sp_dim { 1 sp } </pre> <p>(End of definition for <code>\c__intarray_sp_dim</code>.)</p>
<code>\g__intarray_font_int</code>	Used to assign one font per array. <pre> 23249 \int_new:N \g__intarray_font_int </pre> <p>(End of definition for <code>\g__intarray_font_int</code>.)</p>
<code>\intarray_new:Nn</code> <code>\intarray_new:cn</code> <code>__intarray_new:N</code>	<p>Declare <code>#1</code> to be a font (arbitrarily <code>cmr10</code> at a never-used size). Store the array's size as the <code>\hyphenchar</code> of that font and make sure enough <code>\fontdimen</code> are allocated, by setting the last one. Then clear any <code>\fontdimen</code> that <code>cmr10</code> starts with. It seems LuaTeX's <code>cmr10</code> has an extra <code>\fontdimen</code> parameter number 8 compared to other engines (for a math font we would replace 8 by 22 or some such). Every <code>intarray</code> must be global; it's enough to run this check in <code>\intarray_new:Nn</code>.</p> <pre> 23250 \cs_new_protected:Npn __intarray_new:N #1 23251 { 23252 __kernel_chk_if_free_cs:N #1 23253 \int_gincr:N \g__intarray_font_int 23254 \tex_global:D \tex_font:D #1 23255 = cmr10~at~ \g__intarray_font_int \c__intarray_sp_dim \scan_stop: 23256 \int_step_inline:nn { 8 } 23257 { __kernel_intarray_gset:Nnn #1 {##1} \c_zero_int } 23258 } 23259 \cs_new_protected:Npn \intarray_new:Nn #1#2 23260 { 23261 __intarray_new:N #1 23262 __intarray_count:w #1 = \int_eval:n {#2} \scan_stop: 23263 \int_compare:nNnT { \intarray_count:N #1 } < 0 23264 { 23265 \msg_error:nne { kernel } { negative-array-size } 23266 { \intarray_count:N #1 } 23267 } 23268 \int_compare:nNnT { \intarray_count:N #1 } > 0 23269 { __kernel_intarray_gset:Nnn #1 { \intarray_count:N #1 } { 0 } } 23270 } 23271 \cs_generate_variant:Nn \intarray_new:Nn { c } </pre> <p>(End of definition for <code>\intarray_new:Nn</code> and <code>__intarray_new:N</code>. This function is documented on page 261.)</p>
<code>\intarray_count:N</code> <code>\intarray_count:c</code>	<p>Size of an array.</p> <pre> 23272 \cs_new:Npn \intarray_count:N #1 { \int_value:w __intarray_count:w #1 } 23273 \cs_generate_variant:Nn \intarray_count:N { c } </pre> <p>(End of definition for <code>\intarray_count:N</code>. This function is documented on page 262.)</p>

69.2.2 Array items

`__intarray_signed_max_dim:n` Used when an item to be stored is larger than `\c_max_dim` in absolute value; it is replaced by $\pm\c_max_dim$.

```
23274 \cs_new:Npn \__intarray_signed_max_dim:n #1
23275 { \int_value:w \int_compare:nNnT {#1} < 0 { - } \c_max_dim }
```

(End of definition for `__intarray_signed_max_dim:n`.)

`__intarray_bounds:NNnTF` The functions `\intarray_gset:Nnn` and `\intarray_item:Nn` share bounds checking. `__intarray_bounds_error:NNnw` The T branch is used if #3 is within bounds of the array #2.

```
23276 \cs_new:Npn \__intarray_bounds:NNnTF #1#2#3
23277 {
23278   \if_int_compare:w 1 > #3 \exp_stop_f:
23279   \__intarray_bounds_error:NNnw #1 #2 {#3}
23280   \else:
23281     \if_int_compare:w #3 > \intarray_count:N #2 \exp_stop_f:
23282     \__intarray_bounds_error:NNnw #1 #2 {#3}
23283   \fi:
23284   \fi:
23285   \use_i:nn
23286 }
23287 \cs_new:Npn \__intarray_bounds_error:NNnw #1#2#3#4 \use_i:nn #5#6
23288 {
23289   #4
23290   #1 { kernel } { out-of-bounds }
23291   { \token_to_str:N #2 } {#3} { \intarray_count:N #2 }
23292   #6
23293 }
```

(End of definition for `__intarray_bounds:NNnTF` and `__intarray_bounds_error:NNnw`.)

`\intarray_gset:Nnn` Set the appropriate `\fontdimen`. The `__kernel_intarray_gset:Nnn` function does not use `\int_eval:n`, namely its arguments must be suitable for `\int_value:w`. The user version checks the position and value are within bounds.

`\intarray_gset:cnm`

`__kernel_intarray_gset:Nnn`

`__intarray_gset:Nnn`

`__intarray_gset_overflow:Nnn`

```
23294 \cs_new_protected:Npn \__kernel_intarray_gset:Nnn #1#2#3
23295 { \__intarray_entry:w #2 #1 #3 \c__intarray_sp_dim }
23296 \cs_new_protected:Npn \intarray_gset:Nnn #1#2#3
23297 {
23298   \exp_after:wN \__intarray_gset:Nww
23299   \exp_after:wN #1
23300   \int_value:w \int_eval:n {#2} \exp_after:wN \__intarray_sep:
23301   \int_value:w \int_eval:n {#3} \__intarray_sep:
23302 }
23303 \cs_generate_variant:Nn \intarray_gset:Nnn { c }
23304 \cs_new_protected:Npn \__intarray_gset:Nww #1#2 \__intarray_sep: #3 \__intarray_sep:
23305 {
23306   \__intarray_bounds:NNnTF \msg_error:nneee #1 {#2}
23307   {
23308     \__intarray_gset_overflow_test:nw {#3}
23309     \__kernel_intarray_gset:Nnn #1 {#2} {#3}
23310   }
23311   { }
23312 }
```

```

23313 \cs_if_exist:NTF \tex_ifabsnum:D
23314 {
23315   \cs_new_protected:Npn \__intarray_gset_overflow_test:nw #1
23316   {
23317     \tex_ifabsnum:D #1 > \c_max_dim
23318     \exp_after:wN \__intarray_gset_overflow:NNnn
23319     \fi:
23320   }
23321 }
23322 {
23323   \cs_new_protected:Npn \__intarray_gset_overflow_test:nw #1
23324   {
23325     \if_int_compare:w \int_abs:n {#1} > \c_max_dim
23326     \exp_after:wN \__intarray_gset_overflow:NNnn
23327     \fi:
23328   }
23329 }
23330 \cs_new_protected:Npn \__intarray_gset_overflow:NNnn #1#2#3#4
23331 {
23332   \msg_error:nneeee { kernel } { overflow }
23333   { \token_to_str:N #2 } {#3} {#4} { \__intarray_signed_max_dim:n {#4} }
23334   #1 #2 {#3} { \__intarray_signed_max_dim:n {#4} }
23335 }

```

(End of definition for `\intarray_gset:Nnn` and others. This function is documented on page 262.)

`\intarray_gzero:N` Set the appropriate `\fontdimen` to zero. No bound checking needed. The `\prg_replicate:nn` possibly uses quite a lot of memory, but this is somewhat comparable to the size of the array, and it is much faster than an `\int_step_inline:nn` loop.

`\intarray_gzero:c`

```

23336 \cs_new_protected:Npn \intarray_gzero:N #1
23337 {
23338   \int_zero:N \l__intarray_loop_int
23339   \prg_replicate:nn { \intarray_count:N #1 }
23340   {
23341     \int_incr:N \l__intarray_loop_int
23342     \__intarray_entry:w \l__intarray_loop_int #1 \c_zero_dim
23343   }
23344 }
23345 \cs_generate_variant:Nn \intarray_gzero:N { c }

```

(End of definition for `\intarray_gzero:N`. This function is documented on page 261.)

`\intarray_item:Nn` Get the appropriate `\fontdimen` and perform bound checks. The `__kernel_intarray_item:Nn` function omits bound checks and omits `\int_eval:n`, namely its argument must be a TeX integer suitable for `\int_value:w`.

`\intarray_item:cn`

`__kernel_intarray_item:Nn`

`__intarray_item:Nw`

```

23346 \cs_new:Npn \__kernel_intarray_item:Nn #1#2
23347 { \int_value:w \__intarray_entry:w #2 #1 }
23348 \cs_new:Npn \intarray_item:Nn #1#2
23349 {
23350   \exp_after:wN \__intarray_item:Nw
23351   \exp_after:wN #1
23352   \int_value:w \int_eval:n {#2} \__intarray_sep:
23353 }
23354 \cs_generate_variant:Nn \intarray_item:Nn { c }

```

```

23355 \cs_new:Npn \__intarray_item:Nw #1#2 \__intarray_sep:
23356 {
23357   \__intarray_bounds:NNnTF \msg_expandable_error:nnfff #1 {#2}
23358   { \__kernel_intarray_item:Nn #1 {#2} }
23359   { 0 }
23360 }

```

(End of definition for `\intarray_item:Nn`, `__kernel_intarray_item:Nn`, and `__intarray_item:Nw`. This function is documented on page 262.)

`\intarray_rand_item:N` Importantly, `\intarray_item:Nn` only evaluates its argument once.

```

\intarray_rand_item:c
23361 \cs_new:Npn \intarray_rand_item:N #1
23362 { \intarray_item:Nn #1 { \int_rand:n { \intarray_count:N #1 } } }
23363 \cs_generate_variant:Nn \intarray_rand_item:N { c }

```

(End of definition for `\intarray_rand_item:N`. This function is documented on page 262.)

69.2.3 Working with contents of integer arrays

`\intarray_const_from_clist:Nn` Similar to `\intarray_new:Nn` (which we don't use because when debugging is enabled that function checks the variable name starts with `g_`). We make use of the fact that `TeX` allows allocation of successive `\fontdimen` as long as no other font has been declared: no need to count the comma list items first. We need the code in `\intarray_gset:Nnn` that checks the item value is not too big, namely `__intarray_gset_overflow_test:nw`, but not the code that checks bounds. At the end, set the size of the intarray.

```

23364 \cs_new_protected:Npn \intarray_const_from_clist:Nn #1#2
23365 {
23366   \__intarray_new:N #1
23367   \int_zero:N \l__intarray_loop_int
23368   \clist_map_inline:nn {#2}
23369   { \exp_args:Nf \__intarray_const_from_clist:nN { \int_eval:n {##1} } #1 }
23370   \__intarray_count:w #1 \l__intarray_loop_int
23371 }
23372 \cs_generate_variant:Nn \intarray_const_from_clist:Nn { c }
23373 \cs_new_protected:Npn \__intarray_const_from_clist:nN #1#2
23374 {
23375   \int_incr:N \l__intarray_loop_int
23376   \__intarray_gset_overflow_test:nw {#1}
23377   \__kernel_intarray_gset:Nnn #2 \l__intarray_loop_int {#1}
23378 }

```

(End of definition for `\intarray_const_from_clist:Nn` and `__intarray_const_from_clist:nN`. This function is documented on page 261.)

`__intarray_to_clist:Nn` Loop through the array, putting a comma before each item. Remove the leading comma with `f`-expansion. We also use the auxiliary in `\intarray_show:N` with argument comma, space.

```

23379 \cs_new:Npn \__intarray_to_clist:Nn #1#2
23380 {
23381   \int_compare:nNnF { \intarray_count:N #1 } = \c_zero_int
23382   {
23383     \exp_last_unbraced:Nf \use_none:n
23384     { \__intarray_to_clist:w 1 \__intarray_sep: #1 {#2} \prg_break_point: }
23385   }

```

```

23386     }
23387 \cs_new:Npn \__intarray_to_clist:w #1 \__intarray_sep: #2#3
23388 {
23389     \if_int_compare:w #1 > \__intarray_count:w #2
23390     \prg_break:n
23391     \fi:
23392     #3 \__kernel_intarray_item:Nn #2 {#1}
23393     \exp_after:wN \__intarray_to_clist:w
23394     \int_value:w \int_eval:w #1 + \c_one_int \__intarray_sep: #2 {#3}
23395 }

```

(End of definition for __intarray_to_clist:Nn and __intarray_to_clist:w.)

__kernel_intarray_range_to_clist:Nnn Loop through part of the array.

```

\__intarray_range_to_clist:ww 23396 \cs_new:Npn \__kernel_intarray_range_to_clist:Nnn #1#2#3
23397 {
23398     \exp_last_unbraced:Nf \use_none:n
23399     {
23400         \exp_after:wN \__intarray_range_to_clist:ww
23401         \int_value:w \int_eval:w #2 \exp_after:wN \__intarray_sep:
23402         \int_value:w \int_eval:w #3 \__intarray_sep:
23403         #1 \prg_break_point:
23404     }
23405 }
23406 \cs_new:Npn \__intarray_range_to_clist:ww #1 \__intarray_sep: #2 \__intarray_sep: #3
23407 {
23408     \if_int_compare:w #1 > #2 \exp_stop_f:
23409     \prg_break:n
23410     \fi:
23411     , \__kernel_intarray_item:Nn #3 {#1}
23412     \exp_after:wN \__intarray_range_to_clist:ww
23413     \int_value:w \int_eval:w #1 + \c_one_int \__intarray_sep: #2 \__intarray_sep: #3
23414 }

```

(End of definition for __kernel_intarray_range_to_clist:Nnn and __intarray_range_to_clist:ww.)

__kernel_intarray_gset_range_from_clist:Nnn Loop through part of the array.

```

\__intarray_gset_range:Nw 23415 \cs_new_protected:Npn \__kernel_intarray_gset_range_from_clist:Nnn #1#2#3
23416 {
23417     \int_set:Nn \l__intarray_loop_int {#2}
23418     \__intarray_gset_range:Nw #1 #3 , , \prg_break_point:
23419 }
23420 \cs_new_protected:Npn \__intarray_gset_range:Nw #1 #2 ,
23421 {
23422     \if_catcode:w \scan_stop: \tl_to_str:n {#2} \scan_stop:
23423     \prg_break:n
23424     \fi:
23425     \__kernel_intarray_gset:Nnn #1 \l__intarray_loop_int {#2}
23426     \int_incr:N \l__intarray_loop_int
23427     \__intarray_gset_range:Nw #1
23428 }

```

(End of definition for __kernel_intarray_gset_range_from_clist:Nnn and __intarray_gset_range:Nw.)

```

23429 }

```

69.3 Common parts

`\intarray_if_exist_p:N` Copies of the `cs` functions defined in `l3basics`.

```

\intarray_if_exist_p:c 23430 \prg_new_eq_conditional:NNn \intarray_if_exist:N \cs_if_exist:N
\intarray_if_exist:NTF 23431 { TF , T , F , p }
\intarray_if_exist:cTF 23432 \prg_new_eq_conditional:NNn \intarray_if_exist:c \cs_if_exist:c
23433 { TF , T , F , p }
```

(End of definition for `\intarray_if_exist:N`. This function is documented on page 262.)

`\intarray_show:N` Convert the list to a comma list (with spaces after each comma)

```

\intarray_show:c 23434 \cs_new_protected:Npn \intarray_show:N { \__intarray_show:NN \msg_show:nneeee }
\intarray_log:N 23435 \cs_generate_variant:Nn \intarray_show:N { c }
\intarray_log:c 23436 \cs_new_protected:Npn \intarray_log:N { \__intarray_show:NN \msg_log:nneeee }
23437 \cs_generate_variant:Nn \intarray_log:N { c }
23438 \cs_new_protected:Npn \__intarray_show:NN #1#2
23439 {
23440   \__kernel_chk_defined:NT #2
23441   {
23442     #1 { intarray } { show }
23443     { \token_to_str:N #2 }
23444     { \intarray_count:N #2 }
23445     { >~ \__intarray_to_clist:Nn #2 { , ~ } }
23446     { }
23447   }
23448 }
```

(End of definition for `\intarray_show:N` and `\intarray_log:N`. These functions are documented on page 262.)

23449 `\code`

Chapter 70

l3fp implementation

Nothing to see here: everything is in the subfiles!

Chapter 71

l3fp-aux implementation

```
23450 <*code>
23451 <@@=fp>
```

71.1 Access to primitives

```
  \__fp_int_eval:w
  \__fp_int_eval_end:
  \__fp_int_to_roman:w
```

Largely for performance reasons, we need to directly access primitives rather than use `\int_eval:n`. This happens *a lot*, so we use private names. The same is true for `\romannumeral`, although it is used much less widely.

```
23452 \cs_new_eq:NN \__fp_int_eval:w \tex_numexpr:D
23453 \cs_new_eq:NN \__fp_int_eval_end: \scan_stop:
23454 \cs_new_eq:NN \__fp_int_to_roman:w \tex_romannumeral:D
```

(End of definition for `__fp_int_eval:w`, `__fp_int_eval_end:`, and `__fp_int_to_roman:w`.)

```
\__fp_sep:
```

```
23455 \cs_new_eq:NN \__fp_sep: \__kernel_int_sep:
```

(End of definition for `__fp_sep:`.)

71.2 Internal representation

Internally, a floating point number $\langle X \rangle$ is a token list containing

```
\s__fp \__fp_chk:w <case> <sign> <body> \__fp_sep:
```

Let us explain each piece separately.

Internal floating point numbers are used in expressions, and in this context are subject to **f**-expansion. They must leave a recognizable mark after **f**-expansion, to prevent the floating point number from being re-parsed. Thus, `\s__fp` is simply another name for `\relax`.

When used directly without an accessor function, floating points should produce an error: this is the role of `__fp_chk:w`. We could make floating point variables be protected to prevent them from expanding under **e/x**-expansion, but it seems more convenient to treat them as a subcase of token list variables.

The (decimal part of the) IEEE-754-2008 standard requires the format to be able to represent special floating point numbers besides the usual positive and negative cases. We distinguish the various possibilities by their $\langle \text{case} \rangle$, which is a single digit:

Table 3: Internal representation of floating point numbers.

Representation	Meaning
0 0 \s__fp... __fp_sep:	Positive zero.
0 2 \s__fp... __fp_sep:	Negative zero.
1 0 {\langle exponent \rangle} {\langle X_1 \rangle} {\langle X_2 \rangle} {\langle X_3 \rangle} {\langle X_4 \rangle} \s__fp_sep:	Positive floating point.
1 2 {\langle exponent \rangle} {\langle X_1 \rangle} {\langle X_2 \rangle} {\langle X_3 \rangle} {\langle X_4 \rangle} \s__fp_sep:	Negative floating point.
2 0 \s__fp... __fp_sep:	Positive infinity.
2 2 \s__fp... __fp_sep:	Negative infinity.
3 1 \s__fp... __fp_sep:	Quiet nan.
3 1 \s__fp... __fp_sep:	Signalling nan.

0 zeros: +0 and -0,

1 “normal” numbers (positive and negative),

2 infinities: +inf and -inf,

3 quiet and signalling nan.

The $\langle sign \rangle$ is 0 (positive) or 2 (negative), except in the case of nan, which have $\langle sign \rangle = 1$. This ensures that changing the $\langle sign \rangle$ digit to $2 - \langle sign \rangle$ is exactly equivalent to changing the sign of the number.

Special floating point numbers have the form

\s__fp __fp_chk:w \langle case \rangle \langle sign \rangle \s__fp... __fp_sep:

where \s__fp... is a scan mark carrying information about how the number was formed (useful for debugging).

Normal floating point numbers ($\langle case \rangle = 1$) have the form

\s__fp __fp_chk:w 1 \langle sign \rangle {\langle exponent \rangle} {\langle X_1 \rangle} {\langle X_2 \rangle} {\langle X_3 \rangle} {\langle X_4 \rangle} \s__fp_sep:

Here, the $\langle exponent \rangle$ is an integer, between -10000 and 10000 . The body consists in four blocks of exactly 4 digits, $0000 \leq \langle X_i \rangle \leq 9999$, and the floating point is

$$(-1)^{\langle sign \rangle / 2} \langle X_1 \rangle \langle X_2 \rangle \langle X_3 \rangle \langle X_4 \rangle \cdot 10^{\langle exponent \rangle - 16}$$

where we have concatenated the 16 digits. Currently, floating point numbers are normalized such that the $\langle exponent \rangle$ is minimal, in other words, $1000 \leq \langle X_1 \rangle \leq 9999$.

Calculations are done in base 10000, i.e. one myriad.

71.3 Using arguments and __fp_sep:s

__fp_use_none_stop_f:n This function removes an argument (typically a digit) and replaces it by \exp_stop_f:, a marker which stops f-type expansion.

23456 \cs_new:Npn __fp_use_none_stop_f:n #1 { \exp_stop_f: }

(End of definition for __fp_use_none_stop_f:n.)

`__fp_use_s:n` Those functions place a `__fp_sep:` after one or two arguments (typically digits).

`__fp_use_s:nn`

```

23457 \cs_new:Npn \__fp_use_s:n #1 { #1\__fp_sep: }
23458 \cs_new:Npn \__fp_use_s:nn #1#2 { #1#2\__fp_sep: }

```

(End of definition for `__fp_use_s:n` and `__fp_use_s:nn`.)

`__fp_use_none_until_s:w` Those functions select specific arguments among a set of arguments delimited by a `__fp_sep:`.

`__fp_use_i_until_s:nw`

`__fp_use_ii_until_s:nnw`

```

23459 \cs_new:Npn \__fp_use_none_until_s:w #1\__fp_sep: { }
23460 \cs_new:Npn \__fp_use_i_until_s:nw #1#2\__fp_sep: {#1}
23461 \cs_new:Npn \__fp_use_ii_until_s:nnw #1#2#3\__fp_sep: {#2}

```

(End of definition for `__fp_use_none_until_s:w`, `__fp_use_i_until_s:nw`, and `__fp_use_ii_until_s:nnw`.)

`__fp_reverse_args:Nww` Many internal functions take arguments delimited by `__fp_sep:s`, and it is occasionally useful to swap two such arguments.

```

23462 \cs_new:Npn \__fp_reverse_args:Nww #1 #2\__fp_sep: #3\__fp_sep:
23463 { #1 #3\__fp_sep: #2\__fp_sep: }

```

(End of definition for `__fp_reverse_args:Nww`.)

`__fp_rrot:www` Rotate three arguments delimited by `__fp_sep:s`. This is the inverse (or the square) of the Forth primitive ROT, hence the name.

```

23464 \cs_new:Npn \__fp_rrot:www #1\__fp_sep: #2\__fp_sep: #3\__fp_sep:
23465 { #2\__fp_sep: #3\__fp_sep: #1\__fp_sep: }

```

(End of definition for `__fp_rrot:www`.)

`__fp_use_i:ww` Many internal functions take arguments delimited by `__fp_sep:s`, and it is occasionally useful to remove one or two such arguments.

`__fp_use_i:www`

```

23466 \cs_new:Npn \__fp_use_i:ww #1\__fp_sep: #2\__fp_sep: { #1\__fp_sep: }
23467 \cs_new:Npn \__fp_use_i:www #1\__fp_sep: #2\__fp_sep: #3\__fp_sep: { #1\__fp_sep: }

```

(End of definition for `__fp_use_i:ww` and `__fp_use_i:www`.)

71.4 Constants, and structure of floating points

`__fp_misused:n` This receives a floating point object (floating point number or tuple) and generates an error stating that it was misused. This is called when for instance an `fp` variable is left in the input stream and its contents reach T_EX's stomach.

```

23468 \cs_new_protected:Npn \__fp_misused:n #1
23469 { \msg_error:nne { fp } { misused } { \fp_to_tl:n {#1} } }

```

(End of definition for `__fp_misused:n`.)

`\s__fp` Floating points numbers all start with `\s__fp __fp_chk:w`, where `\s__fp` is equal to the T_EX primitive `\relax`, and `__fp_chk:w` is protected. The rest of the floating point number is made of characters (or `\relax`). This ensures that nothing expands under `f`-expansion, nor under `e/x`-expansion. However, when typeset, `\s__fp` does nothing, and `__fp_chk:w` is expanded. We define `__fp_chk:w` to produce an error.

`__fp_chk:w`

```

23470 \scan_new:N \s__fp
23471 \cs_new_protected:Npn \__fp_chk:w #1 \__fp_sep:
23472 { \__fp_misused:n { \s__fp \__fp_chk:w #1 \__fp_sep: } }

```

(End of definition for `\s__fp` and `__fp_chk:w`.)

`\s__fp_expr_mark` Aliases of `\tex_relax:D`, used to terminate expressions.

`\s__fp_expr_stop` 23473 `\scan_new:N \s__fp_expr_mark`
23474 `\scan_new:N \s__fp_expr_stop`

(End of definition for `\s__fp_expr_mark` and `\s__fp_expr_stop`.)

`\s__fp_mark` Generic scan marks used throughout the module.

`\s__fp_stop` 23475 `\scan_new:N \s__fp_mark`
23476 `\scan_new:N \s__fp_stop`

(End of definition for `\s__fp_mark` and `\s__fp_stop`.)

`__fp_use_i_delimit_by_s_stop:nw` Functions to gobble up to a scan mark.

23477 `\cs_new:Npn __fp_use_i_delimit_by_s_stop:nw #1 #2 \s__fp_stop {#1}`

(End of definition for `__fp_use_i_delimit_by_s_stop:nw`.)

`\s__fp_invalid` A couple of scan marks used to indicate where special floating point numbers come from.

`\s__fp_underflow` 23478 `\scan_new:N \s__fp_invalid`
`\s__fp_overflow` 23479 `\scan_new:N \s__fp_underflow`
`\s__fp_division` 23480 `\scan_new:N \s__fp_overflow`
`\s__fp_exact` 23481 `\scan_new:N \s__fp_division`
23482 `\scan_new:N \s__fp_exact`

(End of definition for `\s__fp_invalid` and others.)

`\c_zero_fp` The special floating points. We define the floating points here as “exact”.

`\c_minus_zero_fp` 23483 `\tl_const:Nn \c_zero_fp { \s__fp __fp_chk:w 0 0 \s__fp_exact __fp_sep: }`
`\c_inf_fp` 23484 `\tl_const:Nn \c_minus_zero_fp { \s__fp __fp_chk:w 0 2 \s__fp_exact __fp_sep: }`
`\c_minus_inf_fp` 23485 `\tl_const:Nn \c_inf_fp { \s__fp __fp_chk:w 2 0 \s__fp_exact __fp_sep: }`
`\c_nan_fp` 23486 `\tl_const:Nn \c_minus_inf_fp { \s__fp __fp_chk:w 2 2 \s__fp_exact __fp_sep: }`
23487 `\tl_const:Nn \c_nan_fp { \s__fp __fp_chk:w 3 1 \s__fp_exact __fp_sep: }`

(End of definition for `\c_zero_fp` and others. These variables are documented on page 275.)

`\c__fp_prec_int` The number of digits of floating points.

`\c__fp_half_prec_int` 23488 `\int_const:Nn \c__fp_prec_int { 16 }`
`\c__fp_block_int` 23489 `\int_const:Nn \c__fp_half_prec_int { 8 }`
23490 `\int_const:Nn \c__fp_block_int { 4 }`

(End of definition for `\c__fp_prec_int`, `\c__fp_half_prec_int`, and `\c__fp_block_int`.)

`\c__fp_myriad_int` Blocks have 4 digits so this integer is useful.

23491 `\int_const:Nn \c__fp_myriad_int { 10000 }`

(End of definition for `\c__fp_myriad_int`.)

`\c__fp_minus_min_exponent_int` Normal floating point numbers have an exponent between `– minus_min_exponent` and
`\c__fp_max_exponent_int` `max_exponent` inclusive. Larger numbers are rounded to $\pm\infty$. Smaller numbers are rounded to ± 0 . It would be more natural to define a `min_exponent` with the opposite sign but that would waste one TeX count.

23492 `\int_const:Nn \c__fp_minus_min_exponent_int { 10000 }`
23493 `\int_const:Nn \c__fp_max_exponent_int { 10000 }`

(End of definition for `\c__fp_minus_min_exponent_int` and `\c__fp_max_exponent_int`.)

`\c__fp_max_exp_exponent_int` If a number's exponent is larger than that, its exponential overflows/underflows.

```

23494 \int_const:Nn \c__fp_max_exp_exponent_int { 5 }

```

(End of definition for `\c__fp_max_exp_exponent_int`.)

`\c__fp_overflowing_fp` A floating point number that is bigger than all normal floating point numbers. This replaces infinities when converting to formats that do not support infinities.

```

23495 \tl_const:Nx \c__fp_overflowing_fp
23496 {
23497   \s__fp \__fp_chk:w 1 0
23498   { \int_eval:n { \c__fp_max_exponent_int + 1 } }
23499   {1000} {0000} {0000} {0000} \__fp_sep:
23500 }

```

(End of definition for `\c__fp_overflowing_fp`.)

`__fp_zero_fp:N` In case of overflow or underflow, we have to output a zero or infinity with a given sign.

`__fp_inf_fp:N`

```

23501 \cs_new:Npn \__fp_zero_fp:N #1
23502 { \s__fp \__fp_chk:w 0 #1 \s__fp_underflow \__fp_sep: }
23503 \cs_new:Npn \__fp_inf_fp:N #1
23504 { \s__fp \__fp_chk:w 2 #1 \s__fp_overflow \__fp_sep: }

```

(End of definition for `__fp_zero_fp:N` and `__fp_inf_fp:N`.)

`__fp_exponent:w` For normal numbers, the function expands to the exponent, otherwise to 0. This is used in `l3str-format`.

```

23505 \cs_new:Npn \__fp_exponent:w \s__fp \__fp_chk:w #1
23506 {
23507   \if_meaning:w 1 #1
23508     \exp_after:wN \__fp_use_ii_until_s:nnw
23509   \else:
23510     \exp_after:wN \__fp_use_i_until_s:nw
23511     \exp_after:wN 0
23512   \fi:
23513 }

```

(End of definition for `__fp_exponent:w`.)

`__fp_neg_sign:N` When appearing in an integer expression or after `\int_value:w`, this expands to the sign opposite to #1, namely 0 (positive) is turned to 2 (negative), 1 (nan) to 1, and 2 to 0.

```

23514 \cs_new:Npn \__fp_neg_sign:N #1
23515 { \__fp_int_eval:w 2 - #1 \__fp_int_eval_end: }

```

(End of definition for `__fp_neg_sign:N`.)

`__fp_kind:w` Expands to 0 for zeros, 1 for normal floating point numbers, 2 for infinities, 3 for `nan`, 4 for tuples.

```

23516 \cs_new:Npn \__fp_kind:w #1
23517 {
23518   \__fp_if_type_fp:NTwFw
23519   #1 \__fp_use_ii_until_s:nnw
23520   \s__fp { \__fp_use_i_until_s:nw 4 }
23521   \s__fp_stop
23522 }

```

(End of definition for `__fp_kind:w`.)

71.5 Overflow, underflow, and exact zero

`__fp_sanitize:Nw` Expects the sign and the exponent in some order, then the significand (which we don't touch). Outputs the corresponding floating point number, possibly underflowed to ± 0 or overflowed to $\pm\infty$. The functions `__fp_underflow:w` and `__fp_overflow:w` are defined in `l3fp-traps`.

```

23523 \cs_new:Npn __fp_sanitize:Nw #1 #2__fp_sep:
23524 {
23525   \if_case:w
23526     \if_int_compare:w #2 > \c__fp_max_exponent_int 1 ~ \else:
23527     \if_int_compare:w #2 < - \c__fp_minus_min_exponent_int 2 ~ \else:
23528     \if_meaning:w 1 #1 3 ~ \fi: \fi: \fi: 0 ~
23529     \or: \exp_after:wN __fp_overflow:w
23530     \or: \exp_after:wN __fp_underflow:w
23531     \or: \exp_after:wN __fp_sanitize_zero:w
23532     \fi:
23533     \s__fp __fp_chk:w 1 #1 {#2}
23534   }
23535 \cs_new:Npn __fp_sanitize:wN #1__fp_sep: #2 { __fp_sanitize:Nw #2 #1__fp_sep: }
23536 \cs_new:Npn __fp_sanitize_zero:w \s__fp __fp_chk:w #1 #2 #3__fp_sep:
23537 { \c_zero_fp }

```

(End of definition for `__fp_sanitize:Nw`, `__fp_sanitize:wN`, and `__fp_sanitize_zero:w`.)

71.6 Expanding after a floating point number

`__fp_exp_after_o:w` `__fp_exp_after_f:nw` `{tokens}` `<floating point>`
 Places `<tokens>` (empty in the case of `__fp_exp_after_o:w`) between the `<floating point>` and the following tokens, then hits those tokens with `o` or `f`-expansion, and leaves the floating point number unchanged.

We first distinguish normal floating points, which have a significand, from the much simpler special floating points.

```

23538 \cs_new:Npn __fp_exp_after_o:w \s__fp __fp_chk:w #1
23539 {
23540   \if_meaning:w 1 #1
23541     \exp_after:wN __fp_exp_after_normal:nNNw
23542   \else:
23543     \exp_after:wN __fp_exp_after_special:nNNw
23544   \fi:
23545   { }
23546   #1
23547 }
23548 \cs_new:Npn __fp_exp_after_f:nw #1 \s__fp __fp_chk:w #2
23549 {
23550   \if_meaning:w 1 #2
23551     \exp_after:wN __fp_exp_after_normal:nNNw
23552   \else:
23553     \exp_after:wN __fp_exp_after_special:nNNw
23554   \fi:
23555   { \exp:w \exp_end_continue_f:w #1 }
23556   #2

```

23557 }

(End of definition for `__fp_exp_after_o:w` and `__fp_exp_after_f:nw`.)

`__fp_exp_after_special:nNNw` `__fp_exp_after_special:nNNw` {*<after>*} *<case>* *<sign>* *<scan mark>* `__fp_sep:`
Special floating point numbers are easy to jump over since they contain few tokens.

23558 `\cs_new:Npn __fp_exp_after_special:nNNw #1#2#3#4__fp_sep:`
23559 {
23560 `\exp_after:wN \s__fp`
23561 `\exp_after:wN __fp_chk:w`
23562 `\exp_after:wN #2`
23563 `\exp_after:wN #3`
23564 `\exp_after:wN #4`
23565 `\exp_after:wN __fp_sep:`
23566 `#1`
23567 }

(End of definition for `__fp_exp_after_special:nNNw`.)

`__fp_exp_after_normal:nNNw` For normal floating point numbers, life is slightly harder, since we have many tokens to jump over. Here it would be slightly better if the digits were not braced but instead were delimited arguments (for instance delimited by ,). That may be changed some day.

23568 `\cs_new:Npn __fp_exp_after_normal:nNNw #1 1 #2 #3 #4#5#6#7__fp_sep:`
23569 {
23570 `\exp_after:wN __fp_exp_after_normal:Nwwwww`
23571 `\exp_after:wN #2`
23572 `\int_value:w #3 \exp_after:wN __fp_sep:`
23573 `\int_value:w 1 #4 \exp_after:wN __fp_sep:`
23574 `\int_value:w 1 #5 \exp_after:wN __fp_sep:`
23575 `\int_value:w 1 #6 \exp_after:wN __fp_sep:`
23576 `\int_value:w 1 #7 \exp_after:wN __fp_sep: #1`
23577 }
23578 `\cs_new:Npn __fp_exp_after_normal:Nwwwww`
23579 `#1 #2__fp_sep: 1 #3 __fp_sep: 1 #4 __fp_sep: 1 #5 __fp_sep: 1 #6 __fp_sep:`
23580 `{ \s__fp __fp_chk:w 1 #1 {#2} {#3} {#4} {#5} {#6} __fp_sep: }`

(End of definition for `__fp_exp_after_normal:nNNw`.)

71.7 Other floating point types

`\s__fp_tuple` Floating point tuples take the form `\s__fp_tuple __fp_tuple_chk:w { <fp 1> <fp 2>`
`__fp_tuple_chk:w` `...} __fp_sep:` where each *<fp>* is a floating point number or tuple, hence ends with
`\c__fp_empty_tuple_fp` `__fp_sep:` itself. When a tuple is typeset, `__fp_tuple_chk:w` produces an error, just
like usual floating point numbers. Tuples may have zero or one element.

23581 `\scan_new:N \s__fp_tuple`
23582 `\cs_new_protected:Npn __fp_tuple_chk:w #1 __fp_sep:`
23583 `{ __fp_misused:n { \s__fp_tuple __fp_tuple_chk:w #1 __fp_sep: } }`
23584 `\tl_const:Nn \c__fp_empty_tuple_fp`
23585 `{ \s__fp_tuple __fp_tuple_chk:w { } __fp_sep: }`

(End of definition for `\s__fp_tuple`, `__fp_tuple_chk:w`, and `\c__fp_empty_tuple_fp`.)

`__fp_tuple_count:w` Count the number of items in a tuple of floating points by counting `__fp_sep:s`. The technique is very similar to `\tl_count:n`, but with the loop built-in. Checking for the end of the loop is done with the `\use_none:n #1` construction.

```

23586 \cs_new:Npn \__fp_array_count:n #1
23587 { \__fp_tuple_count:w \s__fp_tuple \__fp_tuple_chk:w {#1} \__fp_sep: }
23588 \cs_new:Npn \__fp_tuple_count:w \s__fp_tuple \__fp_tuple_chk:w #1 \__fp_sep:
23589 {
23590   \int_value:w \__fp_int_eval:w 0
23591   \__fp_tuple_count_loop:Nw #1 { ? \prg_break: } \__fp_sep:
23592   \prg_break_point:
23593   \__fp_int_eval_end:
23594 }
23595 \cs_new:Npn \__fp_tuple_count_loop:Nw #1#2\__fp_sep:
23596 { \use_none:n #1 + 1 \__fp_tuple_count_loop:Nw }

```

(End of definition for `__fp_tuple_count:w`, `__fp_array_count:n`, and `__fp_tuple_count_loop:Nw`.)

`__fp_if_type_fp:NTwFw` Used as `__fp_if_type_fp:NTwFw <marker> {<true code>} \s__fp {<false code>} \s__fp_stop`, this test whether the `<marker>` is `\s__fp` or not and runs the appropriate `<code>`. The very unusual syntax is for optimization purposes as that function is used for all floating point operations.

```

23597 \cs_new:Npn \__fp_if_type_fp:NTwFw #1 \s__fp #2 #3 \s__fp_stop {#2}

```

(End of definition for `__fp_if_type_fp:NTwFw`.)

`__fp_array_if_all_fp:nTF` True if all items are floating point numbers. Used for min.
`__fp_array_if_all_fp_loop:w`

```

23598 \cs_new:Npn \__fp_array_if_all_fp:nTF #1

```

(End of definition for __fp_change_func_type:NNN, __fp_change_func_type_aux:w, and __fp_change_func_type_chk:NNN.)

```

\__fp_exp_after_any_f:Nnw
\__fp_exp_after_any_f:nw
\__fp_exp_after_expr_stop_f:nw

```

The Nnw function simply dispatches to the appropriate $\backslash _fp_exp_after \dots f:nw$ with “...” (either empty or $_ \langle type \rangle$) extracted from #1, which should start with $\backslash s_fp$. If it doesn’t start with $\backslash s_fp$ the function $\backslash _fp_exp_after_?_f:nw$ defined in `l3fp-parse` gives an error; another special $\langle type \rangle$ is `stop`, useful for loops, see below. The nw function has an important optimization for floating points numbers; it also fetches its type marker #2 from the floating point.

```

23651 \cs_new:Npn \__fp_exp_after_any_f:Nnw #1
23652 { \cs:w __fp_exp_after \__fp_type_from_scan_other:N #1 _f:nw \cs_end: }
23653 \cs_new:Npn \__fp_exp_after_any_f:nw #1#2
23654 {
23655   \__fp_if_type_fp:NTwFw
23656   #2 \__fp_exp_after_f:nw

```

```

23657 \s__fp { \__fp_exp_after_any_f:Nnw #2 }
23658 \s__fp_stop
23659 {#1} #2
23660 }
23661 \cs_new_eq:NN \__fp_exp_after_expr_stop_f:nw \use_none:nn

```

(End of definition for `__fp_exp_after_any_f:Nnw`, `__fp_exp_after_any_f:nw`, and `__fp_exp_after_expr_stop_f:nw`.)

`__fp_exp_after_tuple_o:w` The loop works by using the `n` argument of `__fp_exp_after_any_f:nw` to place the
`__fp_exp_after_tuple_f:nw` loop macro after the next item in the tuple and expand it.
`__fp_exp_after_array_f:w`

```

23677 { \__fp_exp_after_any_f:nw { \__fp_exp_after_array_f:w } }

```

(End of definition for `__fp_exp_after_tuple_o:w`, `__fp_exp_after_tuple_f:nw`, and `__fp_exp_after_array_f:w`.)

71.8 Packing digits

When a positive integer `#1` is known to be less than 10^8 , the following trick splits it into two blocks of 4 digits, padding with zeros on the left.

```

\cs_new:Npn \__fp_pack:NNNNw #1 #2#3#4#5 #6 \__fp_sep: { {#2#3#4#5} {#6} }
\exp_after:wN \__fp_pack:NNNNw
\__fp_int_value:w \__fp_int_eval:w 1 0000 0000 + #1 \__fp_sep:

```

The idea is that adding 10^8 to the number ensures that it has exactly 9 digits, and can then easily find which digits correspond to what position in the number. Of course, this can be modified for any number of digits less or equal to 9 (we are limited by $\text{T}_{\text{E}}\text{X}$'s integers). This method is very heavily relied upon in `l3fp-basics`.

More specifically, the auxiliary inserts `+ #1#2#3#4#5 __fp_sep: {#6}`, which allows us to compute several blocks of 4 digits in a nested manner, performing carries on the fly. Say we want to compute 12345×66778899 . With simplified names, we would do

```

\exp_after:wN \post_processing:w
\__fp_int_value:w \__fp_int_eval:w - 5 0000
\exp_after:wN \__fp_pack:NNNNNw
\__fp_int_value:w \__fp_int_eval:w 4 9995 0000
+ 12345 * 6677
\exp_after:wN \__fp_pack:NNNNNw
\__fp_int_value:w \__fp_int_eval:w 5 0000 0000
+ 12345 * 8899 \__fp_sep:

```

The `\exp_after:wN` triggers `\int_value:w __fp_int_eval:w`, which starts a first computation, whose initial value is $-5\,0000$ (the “leading shift”). In that computation appears an `\exp_after:wN`, which triggers the nested computation `\int_value:w __fp_int_eval:w` with starting value $4\,9995\,0000$ (the “middle shift”). That, in turn, expands `\exp_after:wN` which triggers the third computation. The third computation’s value is $5\,0000\,0000 + 12345 \times 8899$, which has 9 digits. Adding $5 \cdot 10^8$ to the product allowed us to know how many digits to expect as long as the numbers to multiply are not too big; it also works to some extent with negative results. The `pack` function puts the last 4 of those 9 digits into a brace group, moves the `__fp_sep:` delimiter, and inserts a `+`, which combines the carry with the previous computation. The shifts nicely combine into $5\,0000\,0000/10^4 + 4\,9995\,0000 = 5\,0000\,0000$. As long as the operands are in some range, the result of this second computation has 9 digits. The corresponding `pack` function, expanded after the result is computed, braces the last 4 digits, and leaves `+ {5 digits}` for the initial computation. The “leading shift” cancels the combination of the other shifts, and the `\post_processing:w` takes care of packing the last few digits.

Admittedly, this is quite intricate. It is probably the key in making `l3fp` as fast as other pure `TEX` floating point units despite its increased precision. In fact, this is used so much that we provide different sets of packing functions and shifts, depending on ranges of input.

```

\__fp_pack:NNNNNw
\c__fp_trailing_shift_int
\c__fp_middle_shift_int
\c__fp_leading_shift_int

```

This set of shifts allows for computations involving results in the range $[-4 \cdot 10^8, 5 \cdot 10^8 - 1]$. Shifted values all have exactly 9 digits.

```

23678 \int_const:Nn \c__fp_leading_shift_int { - 5 0000 }
23679 \int_const:Nn \c__fp_middle_shift_int { 5 0000 * 9999 }
23680 \int_const:Nn \c__fp_trailing_shift_int { 5 0000 * 10000 }
23681 \cs_new:Npn \__fp_pack:NNNNNw #1 #2#3#4#5 #6\__fp_sep:
23682 { + #1#2#3#4#5 \__fp_sep: {#6} }

```

(End of definition for `__fp_pack:NNNNNw` and others.)

```

\__fp_pack_big:NNNNNNw
\c__fp_big_trailing_shift_int
\c__fp_big_middle_shift_int
\c__fp_big_leading_shift_int

```

This set of shifts allows for computations involving results in the range $[-5 \cdot 10^8, 6 \cdot 10^8 - 1]$ (actually a bit more). Shifted values all have exactly 10 digits. Note that the upper bound is due to `TEX`’s limit of $2^{31} - 1$ on integers. The shifts are chosen to be roughly the mid-point of 10^9 and 2^{31} , the two bounds on 10-digit integers in `TEX`.

```

23683 \int_const:Nn \c__fp_big_leading_shift_int { - 15 2374 }
23684 \int_const:Nn \c__fp_big_middle_shift_int { 15 2374 * 9999 }
23685 \int_const:Nn \c__fp_big_trailing_shift_int { 15 2374 * 10000 }
23686 \cs_new:Npn \__fp_pack_big:NNNNNNw #1#2 #3#4#5#6 #7\__fp_sep:
23687 { + #1#2#3#4#5#6 \__fp_sep: {#7} }

```

(End of definition for `__fp_pack_big:NNNNNNw` and others.)

`_fp_pack_Bigg:NNNNNNw`
`_fp_Bigg_trailing_shift_int`
`\c_fp_Bigg_middle_shift_int`
`\c_fp_Bigg_leading_shift_int`

This set of shifts allows for computations with results in the range $[-1 \cdot 10^9, 147483647]$; the end-point is $2^{31} - 1 - 2 \cdot 10^9 \simeq 1.47 \cdot 10^8$. Shifted values all have exactly 10 digits.

```

23688 \int_const:Nn \c\_fp_Bigg_leading_shift_int { - 20 0000 }
23689 \int_const:Nn \c\_fp_Bigg_middle_shift_int { 20 0000 * 9999 }
23690 \int_const:Nn \c\_fp_Bigg_trailing_shift_int { 20 0000 * 10000 }
23691 \cs_new:Npn \_fp_pack_Bigg:NNNNNNw #1#2 #3#4#5#6 #7\_fp_sep:

(End of definition for `_fp_pack_eight:wNNNNNNNN`.)

`_fp_basics_pack_low:NNNNNw`
`_fp_basics_pack_high:NNNNNw`
`_fp_basics_pack_high_carry:w`

Addition and multiplication of significands are done in two steps: first compute a (more or less) exact result, then round and pack digits in the final (braced) form. These functions take care of the packing, with special attention given to the case where rounding has caused a carry. Since rounding can only shift the final digit by 1, a carry always produces an exact power of 10. Thus, `_fp_basics_pack_high_carry:w` is always followed by four times {0000}.

This is used in l3fp-basics and l3fp-extended.

```

23697 \cs_new:Npn \_fp_basics_pack_low:NNNNNw #1 #2#3#4#5 #6\_fp_sep:
23698 { + #1 - 1 \_fp_sep: {#2#3#4#5} {#6} \_fp_sep: }

```

(End of definition for _fp_basics_pack_weird_low:NNNNw and _fp_basics_pack_weird_high:NNNNNNNNw.)

71.9 Decimate (dividing by a power of 10)

_fp_decimate:nNnnnnn {<shift>} {<f₁>
 {<X₁>} {<X₂>} {<X₃>} {<X₄>}

Each $\langle X_i \rangle$ consists in 4 digits exactly, and $1000 \leq \langle X_1 \rangle < 9999$. The first argument determines by how much we shift the digits. $\langle f_1 \rangle$ is called as follows:

$\langle f_1 \rangle$ $\langle \text{rounding} \rangle$ {<X'₁>} {<X'₂>} $\langle \text{extra-digits} \rangle$ _fp_sep:

where $0 \leq \langle X'_i \rangle < 10^8 - 1$ are 8 digit integers, forming the truncation of our number. In other words,

$$\left(\sum_{i=1}^4 \langle X_i \rangle \cdot 10^{-4i} \cdot 10^{-\langle \text{shift} \rangle} \right) - (\langle X'_1 \rangle \cdot 10^{-8} + \langle X'_2 \rangle \cdot 10^{-16}) = 0. \langle \text{extra-digits} \rangle \cdot 10^{-16} \in [0, 10^{-16}).$$

To round properly later, we need to remember some information about the difference. The $\langle \text{rounding} \rangle$ digit is 0 if and only if the difference is exactly 0, and 5 if and only if the difference is exactly $0.5 \cdot 10^{-16}$. Otherwise, it is the (non-0, non-5) digit closest to 10^{17} times the difference. In particular, if the shift is 17 or more, all the digits are dropped, $\langle \text{rounding} \rangle$ is 1 (not 0), and $\langle X'_1 \rangle$ and $\langle X'_2 \rangle$ are both zero.

If the shift is 1, the $\langle \text{rounding} \rangle$ digit is simply the only digit that was pushed out of the brace groups (this is important for subtraction). It would be more natural for the $\langle \text{rounding} \rangle$ digit to be placed after the $\langle X'_i \rangle$, but the choice we make involves less reshuffling.

Note that this function treats negative $\langle \text{shift} \rangle$ as 0.

```

23718 \cs_new:Npn \_fp\_decimate:nNnnnnn #1
23719 {
23720   \cs:w

```
\_fp\_decimate\_auxi:Nnnnn      \_fp\_decimate\_auxi:Nnnnn  $\langle f_1 \rangle$  { $\langle X_1 \rangle$ } { $\langle X_2 \rangle$ } { $\langle X_3 \rangle$ } { $\langle X_4 \rangle$ }
\_fp\_decimate\_auxii:Nnnnn      Shifting happens in two steps: compute the  $\langle rounding \rangle$  digit, and repack digits into
\_fp\_decimate\_auxiii:Nnnnn      two blocks of 8. The sixteen functions are very similar, and defined through \_fp\_
\_fp\_decimate\_auxiv:Nnnnn      tmp:w. The arguments are as follows: #1 indicates which function is being defined;
\_fp\_decimate\_auxv:Nnnnn      after one step of expansion, #2 yields the “extra digits” which are then converted by
\_fp\_decimate\_auxvi:Nnnnn      \_fp\_round\_digit:Nw to the  $\langle rounding \rangle$  digit (note the + separating blocks of digits
\_fp\_decimate\_auxvii:Nnnnn      to avoid overflowing TEX’s integers). This triggers the f-expansion of \_fp\_decimate\_
\_fp\_decimate\_auxviii:Nnnnn      pack:nnnnnnnnnw,10 responsible for building two blocks of 8 digits, and removing the
\_fp\_decimate\_auxix:Nnnnn      rest. For this to work, #3 alternates between braced and unbraced blocks of 4 digits, in
\_fp\_decimate\_auxxx:Nnnnn      such a way that the 5 first and 5 next token groups yield the correct blocks of 8 digits.

23754 \_fp\_tmp:w {xi}   {\use\_none:n     #3#4+#5}{ 000{0000}0000{#2}#3 #4 #5      }
23755 \_fp\_tmp:w {xii}  {                  #3#4+#5}{ {0000}0000{0000}#2 #3 #4 #5      }
23756 \_fp\_tmp:w {xiii}{\use\_none:nnn#2#3+#4#5}{ 0{0000}0000{0000}#2 #3 #4 #5      }
23757 \_fp\_tmp:w {xiv}  {\use\_none:nn    #2#3+#4#5}{ 00{0000}0000{0000}#2 #3 #4 #5      }
23758 \_fp\_tmp:w {xv}   {\use\_none:n     #2#3+#4#5}{ 000{0000}0000{0000}#2 #3 #4 #5      }
23759 \_fp\_tmp:w {xvi}  {                  #2#3+#4#5}{ {0000}0000{0000}0000 #2 #3 #4 #5 }
```

(End of definition for `_fp_decimate_auxi:Nnnnn` and others.)

¹⁰No, the argument spec is not a mistake: the function calls an auxiliary to do half of the job.

`__fp_decimate_pack:nnnnnnnnnw`

The computation of the *<rounding>* digit leaves an unfinished `\int_value:w`, which expands the following functions. This allows us to repack nicely the digits we keep. Those digits come as an alternation of unbraced and braced blocks of 4 digits, such that the first 5 groups of token consist in 4 single digits, and one brace group (in some order), and the next 5 have the same structure. This is followed by some digits and a `__fp_sep:`.

```
23760 \cs_new:Npn \__fp_decimate_pack:nnnnnnnnnw #1#2#3#4#5
23761 { \__fp_decimate_pack:nnnnnw { #1#2#3#4#5 } }
23762 \cs_new:Npn \__fp_decimate_pack:nnnnnw #1 #2#3#4#5#6
23763 { {#1} {#2#3#4#5#6} }
```

(End of definition for __fp_decimate_pack:nnnnnnnnnw.)

71.10 Functions for use within primitive conditional branches

The functions described in this section are not pretty and can easily be misused. When correctly used, each of them removes one `\fi:` as part of its parameter text, and puts one back as part of its replacement text.

Many computation functions in `l3fp` must perform tests on the type of floating points that they receive. This is often done in an `\if_case:w` statement or another conditional statement, and only a few cases lead to actual computations: most of the special cases are treated using a few standard functions which we define now. A typical use context for those functions would be

```
\if_case:w <integer> \exp_stop_f:
    \__fp_case_return_o:Nw <fp var>
\or: \__fp_case_use:nw {<some computation>}
\or: \__fp_case_return_same_o:w
\or: \__fp_case_return:nw {<something>}
\fi:
<junk>
<floating point>
```

In this example, the case 0 returns the floating point *<fp var>*, expanding once after that floating point. Case 1 does *<some computation>* using the *<floating point>* (presumably compute the operation requested by the user in that non-trivial case). Case 2 returns the *<floating point>* without modifying it, removing the *<junk>* and expanding once after. Case 3 closes the conditional, removes the *<junk>* and the *<floating point>*, and expands *<something>* next. In other cases, the “*<junk>*” is expanded, performing some other operation on the *<floating point>*. We provide similar functions with two trailing *<floating points>*.

`__fp_case_use:nw`

This function ends a TeX conditional, removes junk until the next floating point, and places its first argument before that floating point, to perform some operation on the floating point.

```
23764 \cs_new:Npn \__fp_case_use:nw #1#2 \fi: #3 \s__fp { \fi: #1 \s__fp }
```

(End of definition for __fp_case_use:nw.)

`__fp_case_return:nw` This function ends a \TeX conditional, removes junk and a floating point, and places its first argument in the input stream. A quirk is that we don't define this function requiring a floating point to follow, simply anything ending in a `__fp_sep:`. This, in turn, means that the `\junk` may not contain `__fp_sep:s`.

```
23765 \cs_new:Npn \__fp_case_return:nw #1#2 \fi: #3 \__fp_sep: { \fi: #1 }
```

(End of definition for __fp_case_return:nw.)

`__fp_case_return_o:Nw` This function ends a \TeX conditional, removes junk and a floating point, and returns its first argument (an `\fp var`) then expands once after it.

```
23766 \cs_new:Npn \__fp_case_return_o:Nw #1#2 \fi: #3 \s__fp #4 \__fp_sep:
23767 { \fi: \exp_after:wN #1 }
```

(End of definition for __fp_case_return_o:Nw.)

`__fp_case_return_same_o:w` This function ends a \TeX conditional, removes junk, and returns the following floating point, expanding once after it.

```
23768 \cs_new:Npn \__fp_case_return_same_o:w #1 \fi: #2 \s__fp
23769 { \fi: \__fp_exp_after_o:w \s__fp }
```

(End of definition for __fp_case_return_same_o:w.)

`__fp_case_return_o:Nww` Same as `__fp_case_return_o:Nw` but with two trailing floating points.

```
23770 \cs_new:Npn \__fp_case_return_o:Nww #1#2 \fi: #3 \s__fp #4 \__fp_sep: #5 \__fp_sep:
23771 { \fi: \exp_after:wN #1 }
```

(End of definition for __fp_case_return_o:Nww.)

`__fp_case_return_i_o:ww` Similar to `__fp_case_return_same_o:w`, but this returns the first or second of two trailing floating point numbers, expanding once after the result.

```
23772 \cs_new:Npn \__fp_case_return_i_o:ww
23773 #1 \fi: #2 \s__fp #3 \__fp_sep: \s__fp #4 \__fp_sep:
23774 { \fi: \__fp_exp_after_o:w \s__fp #3 \__fp_sep: }
23775 \cs_new:Npn \__fp_case_return_ii_o:ww #1 \fi: #2 \s__fp #3 \__fp_sep:
23776 { \fi: \__fp_exp_after_o:w }
```

(End of definition for __fp_case_return_i_o:ww and __fp_case_return_ii_o:ww.)

71.11 Integer floating points

`__fp_int_p:w` Tests if the floating point argument is an integer. For normal floating point numbers, `__fp_int:wTF` this holds if the rounding digit resulting from `__fp_decimate:nNnnnn` is 0.

```
23777 \prg_new_conditional:Npnn \__fp_int:w \s__fp \__fp_chk:w #1 #2 #3 #4\__fp_sep:
23778 { TF , T , F , p }
23779 {
23780   \if_case:w #1 \exp_stop_f:
23781     \prg_return_true:
23782   \or:
23783     \if_charcode:w 0
23784       \__fp_decimate:nNnnnn { \c__fp_prec_int - #3 }
23785       \__fp_use_i_until_s:nw #4
23786       \prg_return_true:
23787     \else:
```

```

23788         \prg_return_false:
23789         \fi:
23790     \else: \prg_return_false:
23791     \fi:
23792 }

```

(End of definition for `__fp_int:wTF`.)

71.12 Small integer floating points

`__fp_small_int:wTF` Tests if the floating point argument is an integer or $\pm\infty$. If so, it is clipped to an integer in the range $[-10^8, 10^8]$ and fed as a braced argument to the `<true code>`. Otherwise, the `<false code>` is performed.

First filter special cases: zeros and infinities are integers, `nan` is not. For normal numbers, decimate. If the rounding digit is not 0 run the `<false code>`. If it is, then the integer is `#2 #3`; use `#3` if `#2` vanishes and otherwise `10^8`.

```

23793 \cs_new:Npn \__fp_small_int:wTF \s_fp \__fp_chk:w #1#2
23794 {
23795     \if_case:w #1 \exp_stop_f:
23796         \__fp_case_return:nw { \__fp_small_int_true:wTF 0 \__fp_sep: }
23797     \or: \exp_after:wN \__fp_small_int_normal:NnwTF
23798     \or:
23799         \__fp_case_return:nw
23800         {
23801             \exp_after:wN \__fp_small_int_true:wTF \int_value:w
23802             \if_meaning:w 2 #2 - \fi: 1 0000 0000 \__fp_sep:
23803         }
23804     \else: \__fp_case_return:nw \use_ii:nn
23805     \fi:
23806     #2
23807 }
23808 \cs_new:Npn \__fp_small_int_true:wTF #1\__fp_sep: #2#3 { #2 {#1} }
23809 \cs_new:Npn \__fp_small_int_normal:NnwTF #1#2#3\__fp_sep:
23810 {
23811     \__fp_decimate:nNnnnn { \c__fp_prec_int - #2 }
23812     \__fp_small_int_test:NnnwNw
23813     #3 #1
23814 }
23815 \cs_new:Npn \__fp_small_int_test:NnnwNw #1#2#3#4\__fp_sep: #5
23816 {
23817     \if_meaning:w 0 #1
23818         \exp_after:wN \__fp_small_int_true:wTF
23819         \int_value:w \if_meaning:w 2 #5 - \fi:
23820         \if_int_compare:w #2 > \c_zero_int
23821             1 0000 0000
23822         \else:
23823             #3
23824         \fi:
23825         \exp_after:wN \__fp_sep:
23826     \else:
23827         \exp_after:wN \use_ii:nn
23828     \fi:
23829 }

```

(End of definition for `_fp_small_int:wTF` and others.)

71.13 Fast string comparison

`_fp_str_if_eq:nn` A private version of the low-level string comparison function.

```
23830 \cs_new_eq:NN \_fp_str_if_eq:nn \tex_strcmp:D
```

(End of definition for `_fp_str_if_eq:nn`.)

71.14 Name of a function from its l3fp-parse name

`_fp_func_to_name:N` The goal is to convert for instance `_fp_sin_o:w` to `sin`. This is used in error messages
`_fp_func_to_name_aux:w` hence does not need to be fast.

```
23831 \cs_new:Npn \_fp_func_to_name:N #1
23832 {
23833   \exp_last_unbraced:Nf
23834   \_fp_func_to_name_aux:w { \cs_to_str:N #1 } X
23835 }
23836 \cs_set_protected:Npn \_fp_tmp:w #1 #2
23837 { \cs_new:Npn \_fp_func_to_name_aux:w ##1 #1 ##2 #2 ##3 X {##2} }
23838 \exp_args:Nff \_fp_tmp:w { \tl_to_str:n { \_fp_ } }
23839 { \tl_to_str:n { _o: } }
```

(End of definition for `_fp_func_to_name:N` and `_fp_func_to_name_aux:w`.)

71.15 Messages

Using a floating point directly is an error.

Chapter 72

l3fp-traps implementation

23851 `<*code>`

23852 `<@@=fp>`

Exceptions should be accessed by an `n`-type argument, among

- `invalid_operation`
- `division_by_zero`
- `overflow`
- `underflow`
- `inexact` (actually never used).

72.1 Flags

Flags to denote exceptions.

`\l_fp_invalid_operation_flag`
`\l_fp_division_by_zero_flag`
`\l_fp_overflow_flag`
`\l_fp_underflow_flag`

23853 `\flag_new:N \l_fp_invalid_operation_flag`

23854 `\flag_new:N \l_fp_division_by_zero_flag`

23855 `\flag_new:N \l_fp_overflow_flag`

23856 `\flag_new:N \l_fp_underflow_flag`

(End of definition for `\l_fp_invalid_operation_flag` and others. These variables are documented on page 276.)

72.2 Traps

Exceptions can be trapped to obtain custom behaviour. When an invalid operation or a division by zero is trapped, the trap receives as arguments the result as an `N`-type floating point number, the function name (multiple letters for prefix operations, or a single symbol for infix operations), and the operand(s). When an overflow or underflow is trapped, the trap receives the resulting overly large or small floating point number if it is not too big, otherwise it receives $+\infty$. Currently, the `inexact` exception is entirely ignored.

The behaviour when an exception occurs is controlled by the definitions of the functions

- `_fp_invalid_operation:nw`,

- __fp_invalid_operation_o:Nww,
- __fp_invalid_operation_tl_o:ff,
- __fp_division_by_zero_o:Nnw,
- __fp_division_by_zero_o:NNww,
- __fp_overflow:w,
- __fp_underflow:w.

Rather than changing them directly, we provide a user interface as \fp_trap:nn {*exception*} {*way of trapping*}, where the *way of trapping* is one of error, flag, or none.

We also provide __fp_invalid_operation_o:nw, defined in terms of __fp_invalid_operation:nnw.

\fp_trap:nn

```

23857 \cs_new_protected:Npn \fp_trap:nn #1#2
23858 {
23859   \cs_if_exist_use:cF { __fp_trap_#1_set_#2: }
23860   {
23861     \clist_if_in:nnTF
23862     { invalid_operation , division_by_zero , overflow , underflow }
23863     {#1}
23864     {
23865       \msg_error:nnee { fp }
23866       { unknown-fpu-trap-type } {#1} {#2}
23867     }
23868     {
23869       \msg_error:nne
23870       { fp } { unknown-fpu-exception } {#1}
23871     }
23872   }
23873 }
```

(End of definition for \fp_trap:nn. This function is documented on page 276.)

_fp_trap_invalid_operation_set_error: We provide three types of trapping for invalid operations: either produce an error and raise the relevant flag; or only raise the flag; or don't even raise the flag. In most cases, the function produces as a result its first argument, possibly with post-expansion.

_fp_trap_invalid_operation_set_flag:

_fp_trap_invalid_operation_set_none:

_fp_trap_invalid_operation_set:N

```

23874 \cs_new_protected:Npn \__fp_trap_invalid_operation_set_error:

23937         \exp_after:wN ##1
23938     }
23939 }

```

(End of definition for `__fp_trap_division_by_zero_set_error:` and others.)

Just as for invalid operations and division by zero, the three different behaviours are obtained by feeding `\prg_do_nothing:`, `\use_none:nnnnn` or `\use_none:nnnnnnn` to an auxiliary, with a further auxiliary common to overflow and underflow functions. In most cases, the argument of the `__fp_overflow:w` and `__fp_underflow:w` functions will be an (almost) normal number (with an exponent outside the allowed range), and the error message thus displays that number together with the result to which it overflowed or underflowed. For extreme cases such as `10 ** 1e9999`, the exponent would be too large for T_EX, and `__fp_overflow:w` receives $\pm\infty$ (`__fp_underflow:w` would receive ± 0); then we cannot do better than simply say an overflow or underflow occurred.

```

23940 \cs_new_protected:Npn \__fp_trap_overflow_set_error:
23941 { \__fp_trap_overflow_set:N \prg_do_nothing: }
23942 \cs_new_protected:Npn \__fp_trap_overflow_set_flag:

73.1 Rounding tools

\c__fp_five_int This is used as the half-point for which numbers are rounded up/down.

```
24056 \int_const:Nn \c__fp_five_int { 5 }
```

(End of definition for \c__fp_five_int.)

Floating point operations often yield a result that cannot be exactly represented in a significand with 16 digits. In that case, we need to round the exact result to a representable number. The IEEE standard defines four rounding modes:

- Round to nearest: round to the representable floating point number whose absolute difference with the exact result is the smallest. If the exact result lies exactly at the mid-point between two consecutive representable floating point numbers, round to the floating point number whose last digit is even.
- Round towards negative infinity: round to the greatest floating point number not larger than the exact result.
- Round towards zero: round to a floating point number with the same sign as the exact result, with the largest absolute value not larger than the absolute value of the exact result.
- Round towards positive infinity: round to the least floating point number not smaller than the exact result.

This is not fully implemented in `l3fp` yet, and transcendental functions fall back on the “round to nearest” mode. All rounding for basic algebra is done through the functions defined in this module, which can be redefined to change their rounding behaviour (but there is not interface for that yet).

The rounding tools available in this module are many variations on a base function `__fp_round:NNN`, which expands to `0\exp_stop_f:` or `1\exp_stop_f:` depending on whether the final result should be rounded up or down.

- `__fp_round:NNN <sign> <digit1> <digit2>` can expand to `0\exp_stop_f:` or `1\exp_stop_f:`.
- `__fp_round_s:NNNw <sign> <digit1> <digit2> <more digits>__fp_sep:` can expand to `0\exp_stop_f:__fp_sep:` or `1\exp_stop_f:__fp_sep:`.
- `__fp_round_neg:NNN <sign> <digit1> <digit2>` can expand to `0\exp_stop_f:` or `1\exp_stop_f:`.

See implementation comments for details on the syntax.

```
\__fp_round:NNN
\__fp_round_to_nearest:NNN
  \__fp_round_to_nearest_ninf:NNN
  \__fp_round_to_nearest_zero:NNN
  \__fp_round_to_nearest_pinf:NNN
\__fp_round_to_ninf:NNN
\__fp_round_to_zero:NNN
\__fp_round_to_pinf:NNN
```

```
\__fp_round:NNN <final sign> <digit1> <digit2>
```

If rounding the number `<final sign><digit1>.<digit2>` to an integer rounds it towards zero (truncates it), this function expands to `0\exp_stop_f:`, and otherwise to `1\exp_stop_f:`. Typically used within the scope of an `__fp_int_eval:w`, to add 1 if needed, and thereby round correctly. The result depends on the rounding mode.

It is very important that `<final sign>` be the final sign of the result. Otherwise, the result would be incorrect in the case of rounding towards $-\infty$ or towards $+\infty$. Also recall that `<final sign>` is 0 for positive, and 2 for negative.

By default, the functions below return `0\exp_stop_f:`, but this is superseded by `__fp_round_return_one:`, which instead returns `1\exp_stop_f:`, expanding everything and removing `0\exp_stop_f:` in the process. In the case of rounding towards $\pm\infty$ or towards 0, this is not really useful, but it prepares us for the “round to nearest, ties to even” mode.

The “round to nearest” mode is the default. If the `<digit2>` is larger than 5, then round up. If it is less than 5, round down. If it is exactly 5, then round such that `<digit1>` plus the result is even. In other words, round up if `<digit1>` is odd.

The “round to nearest” mode has three variants, which differ in how ties are rounded: down towards $-\infty$, truncated towards 0, or up towards $+\infty$.

__fp_round_s:NNNw

__fp_round_s:NNNw <final sign> <digit> <more digits> __fp_sep:

Similar to __fp_round:NNN, but with an extra __fp_sep:, this function expands to 0\exp_stop_f:__fp_sep: if rounding <final sign><digit>.<more digits> to an integer truncates, and to 1\exp_stop_f:__fp_sep: otherwise. The <more digits> part must be a digit, followed by something that does not overflow a \int_use:N __fp_int_eval:w construction. The only relevant information about this piece is whether it is zero or not.

```

\_fp_round_to_nearest_pinf_neg:NNN
\_fp_round_to_ninf_neg:NNN
\_fp_round_to_zero_neg:NNN
\_fp_round_to_pinf_neg:NNN

```

_fp_round_neg:NNN $\langle final\ sign \rangle \langle digit_1 \rangle \langle digit_2 \rangle$
This expands to 0\exp_stop_f: or 1\exp_stop_f: after doing the following test. Starting from a number of the form $\langle final\ sign \rangle 0.\langle 15\ digits \rangle \langle digit_1 \rangle$ with exactly 15 (non-all-zero) digits before $\langle digit_1 \rangle$, subtract from it $\langle final\ sign \rangle 0.0\dots 0 \langle digit_2 \rangle$, where there are 16 zeros. If in the current rounding mode the result should be rounded down, then this function returns 1\exp_stop_f:. Otherwise, i.e., if the result is rounded back to the first operand, then this function returns 0\exp_stop_f:.

It turns out that this negative “round to nearest” is identical to the positive one. And this is the default mode.

Chapter 74

l3fp-parse implementation

24331 $\langle *code \rangle$
 24332 $\langle @@=fp \rangle$

74.1 Work plan

The task at hand is non-trivial, and some previous failed attempts show that the code leads to unreadable logs, so we had better get it (almost) right the first time. Let us first describe our goal, then discuss the design precisely before writing any code.

In this file at least, a $\langle floating\ point\ object \rangle$ is a floating point number or tuple. This can be extended to anything that starts with $\backslash s_fp$ or $\backslash s_fp_ \langle type \rangle$ and ends with \backslash_fp_sep : with some internal structure that depends on the $\langle type \rangle$.

$\backslash_fp_parse:n$

$\backslash_fp_parse:n \{ \langle fp\ expr \rangle \}$

Evaluates the $\langle fp\ expr \rangle$ and leaves the result in the input stream as a floating point object. This function forms the basis of almost all public l3fp functions. During evaluation, each token is fully f-expanded.

$\backslash_fp_parse_o:n$ does the same but expands once after its result.

T_EXhackers note: Registers (integers, toks, etc.) are automatically unpacked, without requiring a function such as $\backslash int_use:N$. Invalid tokens remaining after f-expansion lead to unrecoverable low-level T_EX errors.

(End of definition for $\backslash_fp_parse:n$.)

$\backslash c_fp_prec_func_int$

Floating point expressions are composed of numbers, given in various forms, infix operators, such as +, **, or , (which joins two numbers into a list), and prefix operators, such as the unary -, functions, or opening parentheses. Here is a list of precedences which control the order of evaluation (some distinctions are irrelevant for the order of evaluation, but serve as signals), from the tightest binding to the loosest binding.

16 Function calls.

13/14 Binary ** and ^ (right to left).

12 Unary +, -, ! (right to left).

11 Juxtaposition (implicit *) with no parenthesis.

- 10 Binary `*` and `/`.
- 9 Binary `+` and `-`.
- 7 Comparisons.
- 6 Logical `and`, denoted by `&&`.
- 5 Logical `or`, denoted by `||`.
- 4 Ternary operator `?:`, piece `?`.
- 3 Ternary operator `?:`, piece `:`.
- 2 Commas.
- 1 Place where a comma is allowed and generates a tuple.
- 0 Start and end of the expression.

```

24333 \int_const:Nn \c__fp_prec_func_int    { 16 }
24334 \int_const:Nn \c__fp_prec_hatii_int   { 14 }
24335 \int_const:Nn \c__fp_prec_hat_int     { 13 }

24347 \int_const:Nn \c__fp_prec_end_int     { 0 }

```

(End of definition for `\c__fp_prec_func_int` and others.)

74.1.1 Storing results

The main question in parsing expressions expandably is to decide where to put the intermediate results computed for various subexpressions.

One option is to store the values at the start of the expression, and carry them together as the first argument of each macro. However, we want to `f-expand` tokens one by one in the expression (as `\int_eval:n` does), and with this approach, expanding the next unread token forces us to jump with `\exp_after:wN` over every value computed earlier in the expression. With this approach, the run-time grows at least quadratically in the length of the expression, if not as its cube (inserting the `\exp_after:wN` is tricky and slow).

A second option is to place those values at the end of the expression. Then expanding the next unread token is straightforward, but this still hits a performance issue: for long expressions we would be reaching all the way to the end of the expression at every step of the calculation. The run-time is again quadratic.

A variation of the above attempts to place the intermediate results which appear when computing a parenthesized expression near the closing parenthesis. This still lets

us expand tokens as we go, and avoids performance problems as long as there are enough parentheses. However, it would be better to avoid requiring the closing parenthesis to be present as soon as the corresponding opening parenthesis is read: the closing parenthesis may still be hidden in a macro yet to be expanded.

Hence, we need to go for some fine expansion control: the result is stored *before* the start!

Let us illustrate this idea in a simple model: adding positive integers which may be resulting from the expansion of macros, or may be values of registers. Assume that one number, say, 12345, has already been found, and that we want to parse the next number. The current status of the code may look as follows.

```
\exp_after:wN \add:ww \int_value:w 12345 \exp_after:wN ;
\exp:w \operand:w (stuff)
```

One step of expansion expands `\exp_after:wN`, which triggers the primitive `\int_value:w`, which reads the five digits we have already found, 12345. This integer is unfinished, causing the second `\exp_after:wN` to expand, and to trigger the construction `\exp:w`, which expands `\operand:w`, defined to read what follows and make a number out of it, then leave `\exp_end:`, the number, and a `__fp_sep:` in the input stream. Once `\operand:w` is done expanding, we obtain essentially

```
\exp_after:wN \add:ww \int_value:w 12345 \__fp_sep:
\exp:w \exp_end: 333444 \__fp_sep:
```

where in fact `\exp_after:wN` has already been expanded, `\int_value:w` has already seen 12345, and `\exp:w` is still looking for a number. It finds `\exp_end:`, hence expands to nothing. Now, `\int_value:w` sees the `__fp_sep:`, which cannot be part of a number. The expansion stops, and we are left with

```
\add:ww 12345 \__fp_sep: 333444 \__fp_sep:
```

which can safely perform the addition by grabbing two arguments delimited by `__fp_sep:`.

If we were to continue parsing the expression, then the following number should also be cleaned up before the next use of a binary operation such as `\add:ww`. Just like `\int_value:w 12345 \exp_after:wN __fp_sep:` expanded what follows once, we need `\add:ww` to do the calculation, and in the process to expand the following once. This is also true in our real application: all the functions of the form `__fp..._o:ww` expand what follows once. This comes at the cost of leaving tokens in the input stack, and we need to be careful not to waste this memory. All of our discussion above is nice but simplistic, as operations should not simply be performed in the order they appear.

74.1.2 Precedence and infix operators

The various operators we will encounter have different precedences, which influence the order of calculations: $1 + 2 \times 3 = 1 + (2 \times 3)$ because \times has a higher precedence than $+$. The true analog of our macro `\operand:w` must thus take care of that. When looking for an operand, it needs to perform calculations until reaching an operator which has lower precedence than the one which called `\operand:w`. This means that `\operand:w` must know what the previous binary operator is, or rather, its precedence: we thus rename it `\operand:Nw`. Let us describe as an example how we plan to do the calculation

$41-2^3*4+5$. More precisely we describe how to perform the first operation in this expression. Here, we abuse notations: the first argument of `\operand:Nw` should be an integer constant (`\c__fp_prec_plus_int, ...`) equal to the precedence of the given operator, not directly the operator itself.

- Clean up 41 and find `-`. We call `\operand:Nw -` to find the second operand.
- Clean up 2 and find `^`.
- Compare the precedences of `-` and `^`. Since the latter is higher, we need to compute the exponentiation. For this, find the second operand with a nested call to `\operand:Nw ^`.
- Clean up 3 and find `*`.
- Compare the precedences of `^` and `*`. Since the former is higher, `\operand:Nw ^` has found the second operand of the exponentiation, which is computed: $2^3 = 8$.
- We now have $41-8*4+5$, and `\operand:Nw -` is still looking for a second operand for the subtraction. Is it 8?
- Compare the precedences of `-` and `*`. Since the latter is higher, we are not done with 8. Call `\operand:Nw *` to find the second operand of the multiplication.
- Clean up 4, and find `+`.
- Compare the precedences of `*` and `+`. Since the former is higher, `\operand:Nw *` has found the second operand of the multiplication, which is computed: $8*4 = 32$.
- We now have $41-32+5$, and `\operand:Nw -` is still looking for a second operand for the subtraction. Is it 32?
- Compare the precedences of `-` and `+`. Since they are equal, `\operand:Nw -` has found the second operand for the subtraction, which is computed: $41 - 32 = 9$.
- We now have $9+5$.

The procedure above stops short of performing all computations, but adding a surrounding call to `\operand:Nw` with a very low precedence ensures that all computations are performed before `\operand:Nw` is done. Adding a trailing marker with the same very low precedence prevents the surrounding `\operand:Nw` from going beyond the marker.

The pattern above to find an operand for a given operator, is to find one number and the next operator, then compare precedences to know if the next computation should be done. If it should, then perform it after finding its second operand, and look at the next operator, then compare precedences to know if the next computation should be done. This continues until we find that the next computation should not be done. Then, we stop.

We are now ready to get a bit more technical and describe which of the `l3fp-parse` functions correspond to each step above.

First, `__fp_parse_operand:Nw` is the `\operand:Nw` function above, with small modifications due to expansion issues discussed later. We denote by $\langle \textit{precedence} \rangle$ the argument of `__fp_parse_operand:Nw`, that is, the precedence of the binary operator whose operand we are trying to find. The basic action is to read numbers from the input stream. This is done by `__fp_parse_one:Nw`. A first approximation of this function is that it reads one $\langle \textit{number} \rangle$, performing no computation, and finds the following binary $\langle \textit{operator} \rangle$. Then it expands to

```

<number>
  \_fp_parse_infix_<operator>:N <precedence>

```

expanding the `infix` auxiliary before leaving the above in the input stream.

We now explain the `infix` auxiliaries. We need some flexibility in how we treat the case of equal precedences: most often, the first operation encountered should be performed, such as `1-2-3` being computed as `(1-2)-3`, but `2^3^4` should be evaluated as `2^(3^4)` instead. For this reason, and to support the equivalence between `**` and `^` more easily, each binary operator is converted to a control sequence `_fp_parse_infix_<operator>:N` when it is encountered for the first time. Instead of passing both precedences to a test function to do the comparison steps above, we pass the `<precedence>` (of the earlier operator) to the `infix` auxiliary for the following `<operator>`, to know whether to perform the computation of the `<operator>`. If it should not be performed, the `infix` auxiliary expands to

```

@ \use_none:n \_fp_parse_infix_<operator>:N

```

and otherwise it calls `_fp_parse_operand:Nw` with the precedence of the `<operator>` to find its second operand `<number2>` and the next `<operator2>`, and expands to

```

@ \_fp_parse_apply_binary:NwNwN
  <operator> <number2>
@ \_fp_parse_infix_<operator2>:N

```

The `infix` function is responsible for comparing precedences, but cannot directly call the computation functions, because the first operand `<number>` is before the `infix` function in the input stream. This is why we stop the expansion here and give control to another function to close the loop.

A definition of `_fp_parse_operand:Nw <precedence>` with some of the expansion control removed is

```

\exp_after:wN \_fp_parse_continue:NwN
\exp_after:wN <precedence>
\exp:w \exp_end_continue_f:w
  \_fp_parse_one:Nw <precedence>

```

This expands `_fp_parse_one:Nw <precedence>` completely, which finds a number, wraps the next `<operator>` into an `infix` function, feeds this function the `<precedence>`, and expands it, yielding either

```

\_fp_parse_continue:NwN <precedence>
<number> @
\use_none:n \_fp_parse_infix_<operator>:N

```

or

```

\_fp_parse_continue:NwN <precedence>
<number> @
\_fp_parse_apply_binary:NwNwN
  <operator> <number2>
@ \_fp_parse_infix_<operator2>:N

```

The definition of `_fp_parse_continue:NwN` is then very simple:

```

\cs_new:Npn \_fp_parse_continue:NwN #1#2@#3 { #3 #1 #2 @ }

```

In the first case, #3 is `\use_none:n`, yielding

```
\use_none:n <precedence> <number> @
\__fp_parse_infix_<operator>:N
```

then `<number> @ __fp_parse_infix_<operator>:N`. In the second case, #3 is `__fp_parse_apply_binary:NwNwN`, whose role is to compute `<number> <operator> <number2>` and to prepare for the next comparison of precedences: first we get

```
\__fp_parse_apply_binary:NwNwN
  <precedence> <number> @
  <operator> <number2>
@ \__fp_parse_infix_<operator2>:N
```

then

```
\exp_after:wN \__fp_parse_continue:NwN
\exp_after:wN <precedence>
\exp:w \exp_end_continue_f:w
\__fp_<operator>_o:ww <number> <number2>
\exp:w \exp_end_continue_f:w
\__fp_parse_infix_<operator2>:N <precedence>
```

where `__fp_<operator>_o:ww` computes `<number> <operator> <number2>` and expands after the result, thus triggers the comparison of the precedence of the `<operator2>` and the `<precedence>`, continuing the loop.

We have introduced the most important functions here, and the next few paragraphs we describe various subtleties.

74.1.3 Prefix operators, parentheses, and functions

Prefix operators (unary `-`, `+`, `!`) and parentheses are taken care of by the same mechanism, and functions (`sin`, `exp`, etc.) as well. Finding the argument of the unary `-`, for instance, is very similar to grabbing the second operand of a binary infix operator, with a subtle precedence explained below. Once that operand is found, the operator can be applied to it (for the unary `-`, this simply flips the sign). A left parenthesis is just a prefix operator with a very low precedence equal to that of the closing parenthesis (which is treated as an infix operator, since it normally appears just after numbers), so that all computations are performed until the closing parenthesis. The prefix operator associated to the left parenthesis does not alter its argument, but it removes the closing parenthesis (with some checks).

Prefix operators are the reason why we only summarily described the function `__fp_parse_one:Nw` earlier. This function is responsible for reading in the input stream the first possible `<number>` and the next infix `<operator>`. If what follows `__fp_parse_one:Nw <precedence>` is a prefix operator, then we must find the operand of this prefix operator through a nested call to `__fp_parse_operand:Nw` with the appropriate precedence, then apply the operator to the operand found to yield the result of `__fp_parse_one:Nw`. So far, all is simple.

The unary operators `+`, `-`, `!` complicate things a little bit: `-3**2` should be $-(3^2) = -9$, and not $(-3)^2 = 9$. This would easily be done by giving `-` a lower precedence, equal to that of the infix `+` and `-`. Unfortunately, this fails in cases such as `3**-2*4`, yielding $3^{-2 \times 4}$ instead of the correct $3^{-2} \times 4$. A second attempt would be to call `__fp_parse_operand:Nw` with the `<precedence>` of the previous operator, but `0>-2+3` is then

parsed as $0 > -(2+3)$: the addition is performed because it binds more tightly than the comparison which precedes $-$. The correct approach is for a unary $-$ to perform operations whose precedence is greater than both that of the previous operation, and that of the unary $-$ itself. The unary $-$ is given a precedence higher than multiplication and division. This does not lead to any surprising result, since $-(x/y) = (-x)/y$ and similarly for multiplication, and it reduces the number of nested calls to `_fp_parse_operand:Nw`.

Functions are implemented as prefix operators with very high precedence, so that their argument is the first number that can possibly be built.

Note that contrarily to the `infix` functions discussed earlier, the `prefix` functions do perform tests on the previous `<precedence>` to decide whether to find an argument or not, since we know that we need a number, and must never stop there.

74.1.4 Numbers and reading tokens one by one

So far, we have glossed over one important point: what is a “number”? A number is typically given in the form `<significand>e<exponent>`, where the `<significand>` is any non-empty string composed of decimal digits and at most one decimal separator (a period), the exponent “`e<exponent>`” is optional and is composed of an exponent mark `e` followed by a possibly empty string of signs $+$ or $-$ and a non-empty string of decimal digits. The `<significand>` can also be an integer, dimension, skip, or muskip variable, in which case dimensions are converted from points (or mu units) to floating points, and the `<exponent>` can also be an integer variable. Numbers can also be given as floating point variables, or as named constants such as `nan`, `inf` or `pi`. We may add more types in the future.

When `_fp_parse_one:Nw` is looking for a “number”, here is what happens.

- If the next token is a control sequence with the meaning of `\scan_stop:`, it can be: `\s__fp`, in which case our job is done, as what follows is an internal floating point number, or `\s__fp_expr_mark`, in which case the expression has come to an early end, as we are still looking for a number here, or something else, in which case we consider the control sequence to be a bad variable resulting from c-expansion.
- If the next token is a control sequence with a different meaning, we assume that it is a register, unpack it with `\tex_the:D`, and use its value (in `pt` for dimensions and skips, `mu` for muskips) as the `<significand>` of a number: we look for an exponent.
- If the next token is a digit, we remove any leading zeros, then read a significand larger than 1 if the next character is a digit, read a significand smaller than 1 if the next character is a period, or we have found a significand equal to 0 otherwise, and look for an exponent.
- If the next token is a letter, we collect more letters until the first non-letter: the resulting word may denote a function such as `asin`, a constant such as `pi` or be unknown. In the first case, we call `_fp_parse_operand:Nw` to find the argument of the function, then apply the function, before declaring that we are done. Otherwise, we are done, either with the value of the constant, or with the value `nan` for unknown words.
- If the next token is anything else, we check whether it is a known prefix operator, in which case `_fp_parse_operand:Nw` finds its operand. If it is not known, then either a number is missing (if the token is a known infix operator) or the token is simply invalid in floating point expressions.

Once a number is found, `_fp_parse_one:Nw` also finds an infix operator. This goes as follows.

- If the next token is a control sequence, it could be the special marker `\s_fp_expr_mark`, and otherwise it is a case of juxtaposing numbers, such as `2\c_zero_int`, with an implied multiplication.
- If the next token is a letter, it is also a case of juxtaposition, as letters cannot be proper infix operators.
- Otherwise (including in the case of digits), if the token is a known infix operator, the appropriate `_fp_infix_⟨operator⟩:N` function is built, and if it does not exist, we complain. In particular, the juxtaposition `\c_zero_int 2` is disallowed.

In the above, we need to test whether a character token `#1` is a digit:

```
\if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
  is a digit
\else:
  not a digit
\fi:
```

To exclude 0, replace 9 by 10. The use of `\token_to_str:N` ensures that a digit with any catcode is detected. To test if a character token is a letter, we need to work with its character code, testing if `'#1` lies in [65, 90] (uppercase letters) or [97, 112] (lowercase letters)

```
\if_int_compare:w \_fp_int_eval:w
  ( '#1 \if_int_compare:w '#1 > 'Z - 32 \fi: ) / 26 = 3 \exp_stop_f:
  is a letter
\else:
  not a letter
\fi:
```

At all steps, we try to accept all category codes: when `#1` is kept to be used later, it is almost always converted to category code other through `\token_to_str:N`. More precisely, catcodes {3, 6, 7, 8, 11, 12} should work without trouble, but not {1, 2, 4, 10, 13}, and of course {0, 5, 9} cannot become tokens.

Floating point expressions should behave as much as possible like ε -TeX-based integer expressions and dimension expressions. In particular, `f`-expansion should be performed as the expression is read, token by token, forcing the expansion of protected macros, and ignoring spaces. One advantage of expanding at every step is that restricted expandable functions can then be used in floating point expressions just as they can be in other kinds of expressions. Problematically, spaces stop `f`-expansion: for instance, the macro `\X` below would not be expanded if we simply performed `f`-expansion.

```
\DeclareDocumentCommand {\test} {m} { \fp_eval:n {#1} }
\ExplSyntaxOff
\test { 1 + \X }
```

Of course, spaces typically do not appear in a code setting, but may very easily come in document-level input, from which some expressions may come. To avoid this problem, at every step, we do essentially what `\use:f` would do: take an argument, put it back

in the input stream, then **f**-expand it. This is not a complete solution, since a macro’s expansion could contain leading spaces which would stop the **f**-expansion before further macro calls are performed. However, in practice it should be enough: in particular, floating point numbers are correctly expanded to the underlying `\s__fp ...` structure. The **f**-expansion is performed by `__fp_parse_expand:w`.

74.2 Main auxiliary functions

`__fp_parse_operand:Nw` `\exp:w __fp_parse_operand:Nw <precedence> __fp_parse_expand:w`
 Reads the “...”, performing every computation with a precedence higher than `<precedence>`, then expands to

`<result> @ __fp_parse_infix_<operation>:N ...`

where the `<operation>` is the first operation with a lower precedence, possibly `end`, and the “...” start just after the `<operation>`.

(End of definition for __fp_parse_operand:Nw.)

`__fp_parse_infix_+:N` `__fp_parse_infix_+:N <precedence> ...`
 If `+` has a precedence higher than the `<precedence>`, cleans up a second `<operand>` and finds the `<operation2 which follows, and expands to`

`@ __fp_parse_apply_binary:NwNwN + <operand> @ __fp_parse_infix_<operation2>:N ...`

Otherwise expands to

`@ \use_none:n __fp_parse_infix_+:N ...`

A similar function exists for each infix operator.

(End of definition for __fp_parse_infix_+:N.)

`__fp_parse_one:Nw` `__fp_parse_one:Nw <precedence> ...`
 Cleans up one or two operands depending on how the precedence of the next operation compares to the `<precedence>`. If the following `<operation>` has a precedence higher than `<precedence>`, expands to

`<operand1> @ __fp_parse_apply_binary:NwNwN <operation> <operand2> @ __fp_parse_infix_<operation2>:N ...`

and otherwise expands to

`<operand> @ \use_none:n __fp_parse_infix_<operation>:N ...`

(End of definition for __fp_parse_one:Nw.)

74.3 Helpers

`__fp_parse_expand:w` `\exp:w __fp_parse_expand:w <tokens>`

This function must always come within a `\exp:w` expansion. The `<tokens>` should be the part of the expression that we have not yet read. This requires in particular closing all conditionals properly before expanding.

```
24348 \cs_new:Npn \__fp_parse_expand:w #1 { \exp_end_continue_f:w #1 }
```

(End of definition for __fp_parse_expand:w.)

`__fp_parse_return_sep:w` This very odd function swaps its position with the following `\fi:` and removes `__fp_parse_expand:w` normally responsible for expansion. That turns out to be useful.

```
24349 \cs_new:Npn \__fp_parse_return_sep:w
24350     #1 \fi: \__fp_parse_expand:w { \fi: \__fp_sep: #1 }
```

(End of definition for __fp_parse_return_sep:w.)

`__fp_parse_digits_vii:N` These functions must be called within an `\int_value:w` or `__fp_int_eval:w` construction. The first token which follows must be `f`-expanded prior to calling those functions. The functions read tokens one by one, and output digits into the input stream, until meeting a non-digit, or up to a number of digits equal to their index. The full expansion is

```
\__fp_parse_digits_vii:N    <digits> \__fp_sep: <filling 0> \__fp_sep: <length>
\__fp_parse_digits_vi:N
\__fp_parse_digits_v:N
\__fp_parse_digits_iv:N
\__fp_parse_digits_iii:N
\__fp_parse_digits_ii:N
\__fp_parse_digits_i:N
\__fp_parse_digits_:N
```

where `<filling 0>` is a string of zeros such that `<digits> <filling 0>` has the length given by the index of the function, and `<length>` is the number of zeros in the `<filling 0>` string. Each function puts a digit into the input stream and calls the next function, until we find a non-digit. We are careful to pass the tested tokens through `\token_to_str:N` to normalize their category code.

```
24351 \cs_set_protected:Npn \__fp_tmp:w #1 #2 #3
24352 {
24353     \cs_new:cpn { __fp_parse_digits_ #1 :N } ##1
24354     {
24355         \if_int_compare:w 9 < 1 \token_to_str:N ##1 \exp_stop_f:
24356         \token_to_str:N ##1 \exp_after:wN #2 \exp:w
24357         \else:
24358             \__fp_parse_return_sep:w #3 ##1
24359         \fi:
24360         \__fp_parse_expand:w
24361     }
24362 }
24363 \__fp_tmp:w {vii} \__fp_parse_digits_vi:N { 0000000 \__fp_sep: 7 }
24364 \__fp_tmp:w {vi} \__fp_parse_digits_v:N { 000000 \__fp_sep: 6 }
24365 \__fp_tmp:w {v} \__fp_parse_digits_iv:N { 00000 \__fp_sep: 5 }
24366 \__fp_tmp:w {iv} \__fp_parse_digits_iii:N { 0000 \__fp_sep: 4 }
24367 \__fp_tmp:w {iii} \__fp_parse_digits_ii:N { 000 \__fp_sep: 3 }
24368 \__fp_tmp:w {ii} \__fp_parse_digits_i:N { 00 \__fp_sep: 2 }
24369 \__fp_tmp:w {i} \__fp_parse_digits_:N { 0 \__fp_sep: 1 }
24370 \cs_new:Npn \__fp_parse_digits_:N { \__fp_sep: \__fp_sep: 0 }
```

(End of definition for __fp_parse_digits_vii:N and others.)

74.4 Parsing one number

`__fp_parse_one:Nw` This function finds one number, and packs the symbol which follows in an `__fp_parse_infix_...` csname. #1 is the previous $\langle precedence \rangle$, and #2 the first token of the operand. We distinguish four cases: #2 is equal to `\scan_stop:` in meaning, #2 is a different control sequence, #2 is a digit, and #2 is something else (this last case is split further later). Despite the earlier `f`-expansion, #2 may still be expandable if it was protected by `\exp_not:N`, as may happen with the $\text{\LaTeX 2}_{\epsilon}$ command `\protect`. Using a well placed `\reverse_if:N`, this case is sent to `__fp_parse_one_fp:NN` which deals with it robustly.

```

24371 \cs_new:Npn \__fp_parse_one:Nw #1 #2
24372 {
24373   \if_catcode:w \scan_stop: \exp_not:N #2
24374   \exp_after:wN \if_meaning:w \exp_not:N #2 #2 \else:
24375     \exp_after:wN \reverse_if:N
24376     \fi:
24377   \if_meaning:w \scan_stop: #2
24378     \exp_after:wN \exp_after:wN
24379     \exp_after:wN \__fp_parse_one_fp:NN
24380   \else:
24381     \exp_after:wN \exp_after:wN
24382     \exp_after:wN \__fp_parse_one_register:NN
24383   \fi:
24384 \else:
24385   \if_int_compare:w 9 < 1 \token_to_str:N #2 \exp_stop_f:
24386     \exp_after:wN \exp_after:wN
24387     \exp_after:wN \__fp_parse_one_digit:NN
24388   \else:
24389     \exp_after:wN \exp_after:wN
24390     \exp_after:wN \__fp_parse_one_other:NN
24391   \fi:
24392 \fi:
24393 #1 #2
24394 }
```

(End of definition for `__fp_parse_one:Nw`.)

`__fp_parse_one_fp:NN` This function receives a $\langle precedence \rangle$ and a control sequence equal to `\scan_stop:` in meaning. There are three cases.

`_fp_exp_after_expr_mark_f:nw`
`__fp_exp_after_?_f:nw`

- `\s__fp` starts a floating point number, and we call `__fp_exp_after_f:nw`, which `f`-expands after the floating point.
- `\s__fp_expr_mark` is a premature end, we call `__fp_exp_after_expr_mark_f:nw`, which triggers an `fp-early-end` error.
- For a control sequence not containing `\s__fp`, we call `__fp_exp_after_?_f:nw`, causing a `bad-variable` error.

This scheme is extensible: additional types can be added by starting the variables with a scan mark of the form `\s__fp_⟨type⟩` and defining `__fp_exp_after_⟨type⟩_f:nw`. In all cases, we make sure that the second argument of `__fp_parse_infix:NN` is correctly expanded. A special case only enabled in $\text{\LaTeX 2}_{\epsilon}$ is that if `\protect` is encountered then

the error message mentions the control sequence which follows it rather than `\protect` itself. The test for $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}_{2\epsilon}$ uses `\@unexpandable@protect` rather than `\protect` because `\protect` is often `\scan_stop:` hence “does not exist”.

```

This is called whenever #2 is a control sequence other than \scan_stop: in meaning. We special-case \wd, \ht, \dp (see later) and otherwise assume that it is a register, but carefully unpack it with \tex_the:D within braces. First, we find the exponent following #2. Then we unpack #2 with \tex_the:D, and the auxii auxiliary distinguishes integer registers from dimensions/skips from muskips, according to the presence of a period and/or of pt. For integers, simply convert $\langle value \rangle e \langle exponent \rangle$ to a floating point number with __fp_parse:n (this is somewhat wasteful). For other registers, the decimal rounding provided by T_EX does not accurately represent the binary value that it manipulates, so we extract this binary value as a number of scaled points with \int_value:w \dim_to_decimal_in_sp:n { $\langle decimal value \rangle$ pt }, and use an auxiliary of \dim_to_fp:n, which performs the multiplication by 2^{-16} , correctly rounded.

```
\__fp_parse_one_digit:NN
```

A digit marks the beginning of an explicit floating point number. Once the number is found, we catch the case of overflow and underflow with __fp_sanitizewN,

then `__fp_parse_infix_after_operand:NwN` expands `__fp_parse_infix:NN` after the number we find, to wrap the following infix operator as required. Finding the number itself begins by removing leading zeros: further steps are described later.

```

24528 \cs_new:Npn \__fp_parse_one_digit:NN #1
24529 {
24530   \exp_after:wN \__fp_parse_infix_after_operand:NwN
24531   \exp_after:wN #1
24532   \exp:w \exp_end_continue_f:w
24533   \exp_after:wN \__fp_sanitize:wN
24534   \int_value:w \__fp_int_eval:w 0 \__fp_parse_trim_zeros:N
24535 }

```

(End of definition for __fp_parse_one_digit:NN.)

`__fp_parse_one_other:NN` For this function, #2 is a character token which is not a digit. If it is an ASCII letter, `__fp_parse_letters:N` beyond this one and give the result to `__fp_parse_word:Nw`. Otherwise, the character is assumed to be a prefix operator, and we build `__fp_parse_prefix_{operator}:Nw`.

```

24536 \cs_new:Npn \__fp_parse_one_other:NN #1 #2
24537 {
24538   \if_int_compare:w
24539     \__fp_int_eval:w
24540     ( '#2 \if_int_compare:w '#2 > 'Z - 32 \fi: ) / 26
24541     = 3 \exp_stop_f:
24542     \exp_after:wN \__fp_parse_word:Nw

24555     \exp:w
24556   \fi:
24557   \__fp_parse_expand:w
24558 }

```

(End of definition for __fp_parse_one_other:NN.)

`__fp_parse_word:Nw` Finding letters is a simple recursion. Once `__fp_parse_letters:N` has done its job, `__fp_parse_letters:N` we try to build a control sequence from the word #2. If it is a known word, then the corresponding action is taken, and otherwise, we complain about an unknown word, yield `\c_nan_fp`, and look for the following infix operator. Note that the unknown word could be a mistyped function as well as a mistyped constant, so there is no way to tell whether to look for arguments; we do not. The standard requires “inf” and “infinity” and “nan” to be recognized regardless of case, but we probably don’t want to allow every l3fp word to have an arbitrary mixture of lower and upper case, so we test and use a differently-named control sequence.

```

74.4.1 Numbers: trimming leading zeros

Numbers are parsed as follows: first we trim leading zeros, then if the next character is a digit, start reading a significand ≥ 1 with the set of functions __fp_parse_large...; if it is a period, the significand is < 1 ; and otherwise it is zero. In the second case, trim additional zeros after the period, counting them for an exponent shift $\langle \text{exp}_1 \rangle < 0$, then read the significand with the set of functions __fp_parse_small... Once the significand is read, read the exponent if *e* is present.

__fp_parse_trim_zeros:N This function expects an already expanded token. It removes any leading zero, then distinguishes three cases: if the first non-zero token is a digit, then call __fp_parse_large:N (the significand is ≥ 1); if it is ., then continue trimming zeros with __fp_parse_strim_zeros:N; otherwise, our number is exactly zero, and we call __fp_parse_zero: to take care of that case.

```

24616 \cs_new:Npn \__fp_parse_trim_zeros:N #1
24617 {
24618   \if:w 0 \exp_not:N #1
24619     \exp_after:wN \__fp_parse_trim_zeros:N
24620     \exp:w
24621   \else:
24622     \if:w . \exp_not:N #1
24623       \exp_after:wN \__fp_parse_strim_zeros:N

24625     \else:
24626       \__fp_parse_trim_end:w #1
24627     \fi:
24628   \fi:
24629   \__fp_parse_expand:w
24630 }
24631 \cs_new:Npn \__fp_parse_trim_end:w #1 \fi: \fi: \__fp_parse_expand:w
24632 {
24633   \fi:
24634   \fi:
24635   \if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
24636     \exp_after:wN \__fp_parse_large:N
24637   \else:
24638     \exp_after:wN \__fp_parse_zero:

```

```

24639     \fi:
24640     #1
24641 }

```

(End of definition for `__fp_parse_trim_zeros:N` and `__fp_parse_trim_end:w`.)

`__fp_parse_strim_zeros:N` If we have removed all digits until a period (or if the body started with a period), then enter the “`small_trim`” loop which outputs `−1` for each removed 0. Those `−1` are added to an integer expression waiting for the exponent. If the first non-zero token is a digit, call `__fp_parse_small:N` (our significand is smaller than 1), and otherwise, the number is an exact zero. The name `strim` stands for “small trim”.

```

24642 \cs_new:Npn \__fp_parse_strim_zeros:N #1
24643 {
24644     \if:w 0 \exp_not:N #1
24645     - 1
24646     \exp_after:wN \__fp_parse_strim_zeros:N \exp:w
24647     \else:
24648     \__fp_parse_strim_end:w #1
24649     \fi:
24650     \__fp_parse_expand:w
24651 }
24652 \cs_new:Npn \__fp_parse_strim_end:w #1 \fi: \__fp_parse_expand:w
24653 {
24654     \fi:
24655     \if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
24656     \exp_after:wN \__fp_parse_small:N
24657     \else:
24658     \exp_after:wN \__fp_parse_zero:
24659     \fi:
24660     #1
24661 }

```

(End of definition for `__fp_parse_strim_zeros:N` and `__fp_parse_strim_end:w`.)

`__fp_parse_zero:` After reading a significand of 0, find any exponent, then put a sign of 1 for `__fp-sanitize:wN`, which removes everything and leaves an exact zero.

```

24662 \cs_new:Npn \__fp_parse_zero:
24663 {
24664     \exp_after:wN \__fp_sep: \exp_after:wN 1
24665     \int_value:w \__fp_parse_exponent:N
24666 }

```

(End of definition for `__fp_parse_zero:.`)

74.4.2 Number: small significand

`__fp_parse_small:N` This function is called after we have passed the decimal separator and removed all leading zeros from the significand. It is followed by a non-zero digit (with any catcode). The goal is to read up to 16 digits. But we can’t do that all at once, because `\int_value:w` (which allows us to collect digits and continue expanding) can only go up to 9 digits. Hence we grab digits in two steps of 8 digits. Since `#1` is a digit, read seven more digits using `__fp_parse_digits_vii:N`. The `small_leading` auxiliary leaves those digits in the `\int_value:w`, and grabs some more, or stops if there are no more digits. Then the

`pack_leading` auxiliary puts the various parts in the appropriate order for the processing further up.

```

24667 \cs_new:Npn \__fp_parse_small:N #1
24668 {
24669   \exp_after:wN \__fp_parse_pack_leading:NNNNNww
24670   \int_value:w \__fp_int_eval:w 1 \token_to_str:N #1
24671   \exp_after:wN \__fp_parse_small_leading:wwNN
24672   \int_value:w 1
24673   \exp_after:wN \__fp_parse_digits_vii:N
24674   \exp:w \__fp_parse_expand:w
24675 }

```

(End of definition for `__fp_parse_small:N`.)

```

\__fp_parse_small_leading:wwNN
\__fp_parse_small_leading:wwNN 1 <digits> \__fp_sep: <zeros> \__fp_sep:
<number of zeros>

```

We leave `<digits>` `<zeros>` in the input stream: the functions used to grab digits are such that this constitutes digits 1 through 8 of the significand. Then prepare to pack 8 more digits, with an exponent shift of zero (this shift is used in the case of a large significand). If #4 is a digit, leave it behind for the packing function, and read 6 more digits to reach a total of 15 digits: further digits are involved in the rounding. Otherwise put 8 zeros in to complete the significand, then look for an exponent.

```

24676 \cs_new:Npn \__fp_parse_small_leading:wwNN 1 #1 \__fp_sep: #2\__fp_sep: #3 #4
24677 {
24678   #1 #2
24679   \exp_after:wN \__fp_parse_pack_trailing:NNNNNNww
24680   \exp_after:wN 0
24681   \int_value:w \__fp_int_eval:w 1
24682   \if_int_compare:w 9 < 1 \token_to_str:N #4 \exp_stop_f:
24683     \token_to_str:N #4
24684     \exp_after:wN \__fp_parse_small_trailing:wwNN
24685     \int_value:w 1
24686     \exp_after:wN \__fp_parse_digits_vi:N
24687     \exp:w
24688   \else:
24689     0000 0000 \__fp_parse_exponent:Nw #4
24690   \fi:
24691   \__fp_parse_expand:w
24692 }

```

(End of definition for `__fp_parse_small_leading:wwNN`.)

```

\__fp_parse_small_trailing:wwNN
\__fp_parse_small_trailing:wwNN 1 <digits> \__fp_sep: <zeros> \__fp_sep:
<number of zeros> <next token>

```

Leave digits 10 to 15 (arguments #1 and #2) in the input stream. If the `<next token>` is a digit, it is the 16th digit, we keep it, then the `small_round` auxiliary considers this digit and all further digits to perform the rounding: the function expands to nothing, to +0 or to +1. Otherwise, there is no 16-th digit, so we put a 0, and look for an exponent.

```

24693 \cs_new:Npn \__fp_parse_small_trailing:wwNN 1 #1 \__fp_sep: #2\__fp_sep: #3 #4
24694 {
24695   #1 #2
24696   \if_int_compare:w 9 < 1 \token_to_str:N #4 \exp_stop_f:
24697     \token_to_str:N #4

```

```

24701   \else:
24702     0 \__fp_parse_exponent:Nw #4
24703   \fi:
24704   \__fp_parse_expand:w
24705 }

```

(End of definition for `__fp_parse_small_trailing:wwNN`.)

```

\__fp_parse_pack_trailing:NNNNNNww
\__fp_parse_pack_leading:NNNNNNww
\__fp_parse_pack_carry:w

```

Those functions are expanded after all the digits are found, we took care of the rounding, as well as the exponent. The last argument is the exponent. The previous five arguments are 8 digits which we pack in groups of 4, and the argument before that is 1, except in the rare case where rounding lead to a carry, in which case the argument is 2. The `trailing` function has an exponent shift as its first argument, which we add to the exponent found in the `e...` syntax. If the trailing digits cause a carry, the integer expression for the leading digits is incremented (+1 in the code below). If the leading digits propagate this carry all the way up, the function `__fp_parse_pack_carry:w` increments the exponent, and changes the significand from 0000... to 1000...: this is simple because such a carry can only occur to give rise to a power of 10.

```

24706 \cs_new:Npn \__fp_parse_pack_trailing:NNNNNNww

```

(End of definition for `__fp_parse_pack_trailing:NNNNNNww`, `__fp_parse_pack_leading:NNNNNNww`, and `__fp_parse_pack_carry:w`.)

74.4.3 Number: large significand

Parsing a significand larger than 1 is a little bit more difficult than parsing small significands. We need to count the number of digits before the decimal separator, and add that to the final exponent. We also need to test for the presence of a dot each time we run out of digits, and branch to the appropriate `parse_small` function in those cases.

```

\__fp_parse_large:N

```

This function is followed by the first non-zero digit of a “large” significand (≥ 1). It is called within an integer expression for the exponent. Grab up to 7 more digits, for a total of 8 digits.

```

24720 \cs_new:Npn \__fp_parse_large:N #1
24721   {
24722     \exp_after:wN \__fp_parse_large_leading:wwNN
24723     \int_value:w 1 \token_to_str:N #1

```

```

24724         \exp_after:wN \__fp_parse_digits_vii:N
24725         \exp:w \__fp_parse_expand:w
24726     }

```

(End of definition for __fp_parse_large:N.)

```

\__fp_parse_large_leading:wwNN
    \__fp_parse_large_leading:wwNN 1 <digits> \__fp_sep: <zeros> \__fp_sep:
    <number of zeros> <next token>

```

We shift the exponent by the number of digits in #1, namely the target number, 8, minus the <number of zeros> (number of digits missing). Then prepare to pack the 8 first digits. If the <next token> is a digit, read up to 6 more digits (digits 10 to 15). If it is a period, try to grab the end of our 8 first digits, branching to the `small` functions since the number of digit does not affect the exponent anymore. Finally, if this is the end of the significand, insert the <zeros> to complete the 8 first digits, insert 8 more, and look for an exponent.

```

24727 \cs_new:Npn \__fp_parse_large_leading:wwNN 1 #1 \__fp_sep: #2\__fp_sep: #3 #4

(End of definition for __fp_parse_large_leading:wwNN.)

```

\__fp_parse_large_trailing:wwNN
    \__fp_parse_large_trailing:wwNN 1 <digits> \__fp_sep: <zeros> \__fp_sep:
    <number of zeros> <next token>

```

We have just read 15 digits. If the <next token> is a digit, then the exponent shift caused by this block of 8 digits is 8, first argument to the `pack_trailing` function. We keep the <digits> and this 16-th digit, and find how this should be rounded using `__fp_parse_large_round:NN`. Otherwise, the exponent shift is the number of

$\langle \text{digits} \rangle$, 7 minus the $\langle \text{number of zeros} \rangle$, and we test for a decimal point. This case happens in 123451234512345.67 with exactly 15 digits before the decimal separator. Then branch to the appropriate small auxiliary, grabbing a few more digits to complement the digits we already grabbed. Finally, if this is truly the end of the significand, look for an exponent after using the $\langle \text{zeros} \rangle$ and providing a 16-th digit of 0.

74.4.4 Number: beyond 16 digits, rounding

`__fp_parse_round_loop:N` This loop is called when rounding a number (whether the mantissa is small or large).
`__fp_parse_round_up:N` It should appear in an integer expression. This function reads digits one by one, until reaching a non-digit, and adds 1 to the integer expression for each digit. If all digits found are 0, the function ends the expression by `__fp_sep:0`, otherwise by `__fp_sep:1`. This is done by switching the loop to `round_up` at the first non-zero digit, thus we avoid to test whether digits are 0 or not once we see a first non-zero digit.

```

24785 \cs_new:Npn \__fp_parse_round_loop:N #1
24786 {
24787   \if_int_compare:w 9 < 1 \token_to_str:N #1 \exp_stop_f:
24788     + 1

24811 }

```

(End of definition for __fp_parse_round_loop:N and __fp_parse_round_up:N.)

__fp_parse_round_after:wN After the loop __fp_parse_round_loop:N, this function fetches an exponent with __fp_parse_exponent:N, and combines it with the number of digits counted by __fp_parse_round_loop:N. At the same time, the result 0 or 1 is added to the surrounding integer expression.

```

24812 \cs_new:Npn \__fp_parse_round_after:wN #1\__fp_sep: #2
24813 {
24814     + #2 \exp_after:wN \__fp_sep:
24815     \int_value:w \__fp_int_eval:w #1 + \__fp_parse_exponent:N
24816 }

```

(End of definition for __fp_parse_round_after:wN.)

__fp_parse_small_round:NN Here, #1 is the digit that we are currently rounding (we only care whether it is even or odd). If #2 is not a digit, then fetch an exponent and expand to __fp_sep:<exponent> only. Otherwise, we expand to +0 or +1, then __fp_sep:<exponent>. To decide which, call __fp_round_s:NNNw to know whether to round up, giving it as arguments a sign 0 (all explicit numbers are positive), the digit #1 to round, the first following digit #2, and either +0 or +1 depending on whether the following digits are all zero or not. This last argument is obtained by __fp_parse_round_loop:N, whose number of digits we discard by multiplying it by 0. The exponent which follows the number is also fetched by __fp_parse_round_after:wN.

```

24817 \cs_new:Npn \__fp_parse_small_round:NN #1#2
24818 {
24819     \if_int_compare:w 9 < 1 \token_to_str:N #2 \exp_stop_f:
24820         +
24821         \exp_after:wN \__fp_round_s:NNNw

24828         \exp_after:wN \__fp_parse_round_loop:N

```

```

24829         \exp:w
24830     \else:
24831         \__fp_parse_exponent:Nw #2
24832     \fi:
24833     \__fp_parse_expand:w
24834 }

```

(End of definition for __fp_parse_small_round:NN and __fp_parse_round_after:wN.)

```

\__fp_parse_large_round:NN
  \__fp_parse_large_round_test:NN
  \__fp_parse_large_round_aux:wNN

```

Large numbers are harder to round, as there may be a period in the way. Again, #1 is the digit that we are currently rounding (we only care whether it is even or odd). If there are no more digits (#2 is not a digit), then we must test for a period: if there is one, then switch to the rounding function for small significands, otherwise fetch an exponent. If there are more digits (#2 is a digit), then round, checking with __fp_parse_round_loop:N if all further digits vanish, or some are non-zero. This loop is not enough, as it is stopped by a period. After the loop, the aux function tests for a period: if it is present, then we must continue looking for digits, this time discarding the number of digits we find.

```

74.4.5 Number: finding the exponent

Expansion is a little bit tricky here, in part because we accept input where multiplication is implicit.

```

\__fp_parse:n { 3.2 erf(0.1) }
\__fp_parse:n { 3.2 e\l_my_int }
\__fp_parse:n { 3.2 \c_pi_fp }

```

The first case indicates that just looking one character ahead for an “e” is not enough, since we would mistake the function `erf` for an exponent of “rf”. An alternative would be to look two tokens ahead and check if what follows is a sign or a digit, considering in that case that we must be finding an exponent. But taking care of the second case requires that we unpack registers after `e`. However, blindly expanding the two tokens ahead completely would break the third example (unpacking is even worse). Indeed, in the course of reading `3.2`, `\c_pi_fp` is expanded to `\s__fp __fp_chk:w 1 0 {-1} {3141} ... __fp_sep:` and `\s__fp` stops the expansion. Expanding two tokens ahead would then force the expansion of `__fp_chk:w` (despite it being protected), and that function tries to produce an error.

What can we do? Really, the reason why this last case breaks is that just as `TEX` does, we should read ahead as little as possible. Here, the only case where there may be an exponent is if the first token ahead is `e`. Then we expand (and possibly unpack) the second token.

`__fp_parse_exponent:Nw` This auxiliary is convenient to smuggle some material through `\fi:` ending conditional processing. We place those `\fi:` (argument #2) at a very odd place because this allows us to insert `__fp_int_eval:w ...` there if needed.

```

24879 \cs_new:Npn \__fp_parse_exponent:Nw #1 #2 \__fp_parse_expand:w
24880 {
24881     \exp_after:wN \__fp_sep:
24882     \int_value:w #2 \__fp_parse_exponent:N #1
24883 }

```

(End of definition for `__fp_parse_exponent:Nw`.)

`__fp_parse_exponent:N` This function should be called within an `\int_value:w` expansion (or within an integer expression). It leaves digits of the exponent behind it in the input stream, and terminates the expansion with a `__fp_sep:.` If there is no `e` (or `E`), leave an exponent of 0. If there is an `e` or `E`, expand the next token to run some tests on it. The first rough test is that if the character code of #1 is greater than that of 9 (largest code valid for an exponent,

less than any code valid for an identifier), there was in fact no exponent; otherwise, we search for the sign of the exponent.

```

24884 \cs_new:Npn \__fp_parse_exponent:N #1
24885 {
24886   \if:w e \if:w E \exp_not:N #1 e \else: \exp_not:N #1 \fi:

74.5 Constants, functions and prefix operators

74.5.1 Prefix operators

__fp_parse_prefix_+:Nw A unary + does nothing: we should continue looking for a number.

```

24974 \cs_new_eq:cN { __fp_parse_prefix_+:Nw } \__fp_parse_one:Nw

```

(End of definition for __fp_parse_prefix_+:Nw.)

__fp_parse_apply_function:NNNwN Here, #1 is a precedence, #2 is some extra data used by some functions, #3 is *e.g.*, __fp_sin_o:w, and expands once after the calculation, #4 is the operand, and #5 is a __fp_parse_infix...:N function. We feed the data #2, and the argument #4, to the function #3, which expands \exp:w thus the infix function #5.

```

24975 \cs_new:Npn \__fp_parse_apply_function:NNNwN #1#2#3#4#5
24976 {
24977     #3 #2 #4 @
24978     \exp:w \exp_end_continue_f:w #5 #1
24979 }

```

(End of definition for __fp_parse_apply_function:NNNwN.)

__fp_parse_apply_unary:NNNwN In contrast to __fp_parse_apply_function:NNNwN, this checks that the operand #4 is a single argument (namely there is a single __fp_sep:). We use the fact that any floating point starts with a “safe” token like \s__fp. If there is no argument produce the `fp-no-arg` error; if there are at least two produce `fp-multi-arg`. For the error message extract the mathematical function name (such as `sin`) from the `expl3` function that computes it, such as __fp_sin_o:w.

In addition, since there is a single argument we can dispatch on type and check that the resulting function exists. This catches things like `sin((1,2))` where it does not make sense to take the sine of a tuple.

```

24980 \cs_new:Npn \__fp_parse_apply_unary:NNNwN #1#2#3#4#5
24981 {
24982     \__fp_parse_apply_unary_chk:NwNw #4 @ \__fp_sep: . \s__fp_stop
24983     \__fp_parse_apply_unary_type:NNN
24984     #3 #2 #4 @

(End of definition for __fp_parse_prefix_-:Nw and __fp_parse_prefix_!:Nw.)

__fp_parse_prefix_:Nw

Numbers which start with a decimal separator (a period) end up here. Of course, we do not look for an operand, but for the rest of the number. This function is very similar to __fp_parse_one_digit:NN but calls __fp_parse_strim_zeros:N to trim zeros after the decimal point, rather than the trim_zeros function for zeros before the decimal point.

```

25027 \cs_new:cpn { __fp_parse_prefix_:Nw } #1

25034 }

```

(End of definition for __fp_parse_prefix_:Nw.)

__fp_parse_prefix_(:Nw
__fp_parse_lparen_after:NwN

The left parenthesis is treated as a unary prefix operator because it appears in exactly the same settings. If the previous precedence is \c__fp_prec_func_int we are parsing arguments of a function and commas should not build tuples; otherwise commas should build tuples. We distinguish these cases by precedence: \c__fp_prec_comma_int for the case of arguments, \c__fp_prec_tuple_int for the case of tuples. Once the operand is found, the lparen_after auxiliary makes sure that there was a closing parenthesis (otherwise it complains), and leaves in the input stream an operand, fetching the following infix operator.

```

25035 \cs_new:cpn { __fp_parse_prefix_(:Nw } #1
25036 {
25037   \exp_after:wN \__fp_parse_lparen_after:NwN

25142 }

```

(End of definition for `__fp_parse_unary_function:NNN` and `__fp_parse_function:NNN`.)

74.6 Main functions

`__fp_parse:n` Start an `\exp:w` expansion so that `__fp_parse:n` expands in two steps. The `__fp_parse_operand:Nw` function performs computations until reaching an operation with precedence `\c__fp_prec_end_int` or less, namely, the end of the expression. The marker `\s__fp_expr_mark` indicates that the next token is an already parsed version of an infix operator, and `__fp_parse_infix_end:N` has infinitely negative precedence. Finally, clean up a (well-defined) set of extra tokens and stop the initial expansion with `\exp_end:.`

```

25143 \cs_new:Npn \__fp_parse:n #1
25144 {
25145   \exp:w
25146   \exp_after:wN \__fp_parse_after:ww
25147   \exp:w
25148   \__fp_parse_operand:Nw \c__fp_prec_end_int
25149   \__fp_parse_expand:w #1
25150   \s__fp_expr_mark \__fp_parse_infix_end:N
25151   \s__fp_expr_stop
25152   \exp_end:
25153 }
25154 \cs_new:Npn \__fp_parse_after:ww
25155   #1@ \__fp_parse_infix_end:N \s__fp_expr_stop #2 { #2 #1 }
25156 \cs_new:Npn \__fp_parse_o:n #1
25157 {

25310 }

```

(End of definition for __fp_parse_infix_after_paren:NN.)

74.7.1 Closing parentheses and commas

`__fp_parse_infix_mark:NNN` As an infix operator, `\s__fp_expr_mark` means that the next token (#3) has already gone through `__fp_parse_infix:NN` and should be provided the precedence #1. The scan mark #2 is discarded.

```
25311 \cs_new:Npn \__fp_parse_infix_mark:NNN #1#2#3 { #3 #1 }
```

(End of definition for __fp_parse_infix_mark:NNN.)

`__fp_parse_infix_end:N` This one is a little bit odd: force every previous operator to end, regardless of the precedence.

```
25312 \cs_new:Npn \__fp_parse_infix_end:N #1
25313 { @ \use_none:n \__fp_parse_infix_end:N }
```

(End of definition for __fp_parse_infix_end:N.)

`__fp_parse_infix_):N` This is very similar to `__fp_parse_infix_end:N`, complaining about an extra closing parenthesis if the previous operator was the beginning of the expression, with precedence `\c__fp_prec_end_int`.

```
25314 \cs_set_protected:Npn \__fp_tmp:w #1
25315 {
25316   \cs_new:Npn #1 ##1
25317   {
25318     \if_int_compare:w ##1 > \c__fp_prec_end_int
25319     \exp_after:wN @
25320     \exp_after:wN \use_none:n
25321     \exp_after:wN #1
25322   \else:
25323     \msg_expandable_error:nnn { fp } { extra } { } }
25324     \exp_after:wN \__fp_parse_infix:NN
25325     \exp_after:wN ##1
25326     \exp:w \exp_after:wN \__fp_parse_expand:w
25327   \fi:
25328   }
25329 }
25330 \exp_args:Nc \__fp_tmp:w { __fp_parse_infix_):N }
```

(End of definition for __fp_parse_infix_):N.)

`__fp_parse_infix_,:N` As for other infix operations, if the previous operations has higher precedence the comma waits. Otherwise we call `__fp_parse_operand:Nw` to read more comma-delimited arguments that `__fp_parse_infix_comma:w` simply concatenates into a @-delimited array. The first comma in a tuple that is not a function argument is distinguished: in that case call `__fp_parse_apply_comma:NwNwN` whose job is to convert the first item of the tuple and an array of the remaining items into a tuple. In contrast to `__fp_parse_apply_binary:NwNwN` this function's operands are not single-object arrays.

```
25331 \cs_set_protected:Npn \__fp_tmp:w #1
25332 {
25333   \cs_new:Npn #1 ##1
25334   {
25335     \if_int_compare:w ##1 > \c__fp_prec_comma_int
25336     \exp_after:wN @
25337     \exp_after:wN \use_none:n
25338     \exp_after:wN #1
```

```

25339         \else:
25340             \if_int_compare:w ##1 < \c__fp_prec_comma_int

25364         #5 #1
25365     }

```

(End of definition for __fp_parse_infix_,:N, __fp_parse_infix_comma:w, and __fp_parse_apply_comma:NwNwN.)

74.7.2 Usual infix operators

As described in the “work plan”, each infix operator has an associated `\..._infix...` function, a computing function, and precedence, given as arguments to `__fp_tmp:w`. Using the general mechanism for arithmetic operations. The power operation must be associative in the opposite order from all others. For this, we use two distinct precedences.

```

\__fp_parse_infix_+:N
\__fp_parse_infix_-:N
\__fp_parse_infix_juxt:N
\__fp_parse_infix_/:N
\__fp_parse_infix_mul:N

25566 \cs_new:Npn \__fp_parse_continue_compare:NNwNN #1#2 #3@ #4#5
25567 { #4 #2 #3@ #1 }

```

(End of definition for __fp_parse_infix_<:N and others.)

74.8 Tools for functions

`_fp_parse_function_all_fp_o:fnw` Followed by `{⟨function name⟩} {⟨code⟩} ⟨float array⟩ @` this checks all floats are floating point numbers (no tuples).

```

25568 \cs_new:Npn \_fp_parse_function_all_fp_o:fnw #1#2#3 @
25569 {
25570   \_fp_array_if_all_fp:nTF {#3}
25571   { #2 #3 @ }
25572   {
25573     \_fp_error:nffn { bad-args }
25574     {#1}
25575     { \fp_to_tl:n { \s__fp_tuple \_fp_tuple_chk:w {#3} \_fp_sep: } }
25576     { }
25577     \exp_after:wN \c_nan_fp
25578   }
25579 }
```

(End of definition for `_fp_parse_function_all_fp_o:fnw`.)

`_fp_parse_function_one_two:nnw` This is followed by `{⟨function name⟩} {⟨code⟩} ⟨float array⟩ @`. It checks that the `⟨float array⟩` consists of one or two floating point numbers (not tuples), then leaves `⟨code⟩` (if there is one float) or its tail (if there are two floats) followed by the `⟨float array⟩`. The `⟨code⟩` should start with a single token such as `_fp_atan_default:w` that deals with the single-float case.

The first `_fp_if_type_fp:NTwFw` test catches the case of no argument and the case of a tuple argument. The next one distinguishes the case of a single argument (no error, just add `\c_one_fp`) from a tuple second argument. Finally check there is no further argument.

```

25580 \cs_new:Npn \_fp_parse_function_one_two:nnw #1#2#3

Chapter 75

l3fp-assign implementation

```
25687 <*code>
25688 <@@=fp>
```

75.1 Assigning values

\fp_new:N Floating point variables are initialized to be +0.

```
25689 \cs_new_protected:Npn \fp_new:N #1
25690 { \cs_new_eq:NN #1 \c_zero_fp }
25691 \cs_generate_variant:Nn \fp_new:N {c}
```

(End of definition for \fp_new:N. This function is documented on page 266.)

\fp_set:Nn Simply use __fp_parse:n within various f-expanding assignments.

```
\fp_set:cn 25692 \cs_new_protected:Npn \fp_set:Nn #1#2
\fp_set:NV 25693 { \__kernel_tl_set:Nx #1 { \exp_not:f { \__fp_parse:n {#2} } } }
\fp_set:cV 25694 \cs_new_protected:Npn \fp_gset:Nn #1#2
\fp_gset:Nn 25695 { \__kernel_tl_gset:Nx #1 { \exp_not:f { \__fp_parse:n {#2} } } }
\fp_gset:cn 25696 \cs_new_protected:Npn \fp_const:Nn #1#2
\fp_gset:NV 25697 { \tl_const:Ne #1 { \exp_not:f { \__fp_parse:n {#2} } } }
\fp_gset:cV 25698 \cs_generate_variant:Nn \fp_set:Nn { NV , c , cV }
\fp_const:Nn 25699 \cs_generate_variant:Nn \fp_gset:Nn { NV , c , cV }
\fp_const:cn 25700 \cs_generate_variant:Nn \fp_const:Nn {c}
```

(End of definition for \fp_set:Nn, \fp_gset:Nn, and \fp_const:Nn. These functions are documented on page 266.)

\fp_set_eq:NN Copying a floating point is the same as copying the underlying token list.

```
\fp_set_eq:cn 25701 \cs_new_eq:NN \fp_set_eq:NN \tl_set_eq:NN
\fp_set_eq:Nc 25702 \cs_new_eq:NN \fp_gset_eq:NN \tl_gset_eq:NN
\fp_set_eq:cc 25703 \cs_generate_variant:Nn \fp_set_eq:NN { c , Nc , cc }
\fp_gset_eq:NN 25704 \cs_generate_variant:Nn \fp_gset_eq:NN { c , Nc , cc }
\fp_gset_eq:cn
\fp_gset_eq:Nc
\fp_gset_eq:cc
```

(End of definition for \fp_set_eq:NN and \fp_gset_eq:NN. These functions are documented on page 266.)

```

\fp_zero:N Setting a floating point to zero: copy \c_zero_fp.
\fp_zero:c 25705 \cs_new_protected:Npn \fp_zero:N #1 { \fp_set_eq:NN #1 \c_zero_fp }
\fp_gzero:N 25706 \cs_new_protected:Npn \fp_gzero:N #1 { \fp_gset_eq:NN #1 \c_zero_fp }
\fp_gzero:c 25707 \cs_generate_variant:Nn \fp_zero:N { c }
25708 \cs_generate_variant:Nn \fp_gzero:N { c }

(End of definition for \fp_zero:N and \fp_gzero:N. These functions are documented on page 266.)

```

```

\fp_zero_new:N Set the floating point to zero, or define it if needed.
\fp_zero_new:c 25709 \cs_new_protected:Npn \fp_zero_new:N #1
\fp_gzero_new:N 25710 { \fp_if_exist:NTF #1 { \fp_zero:N #1 } { \fp_new:N #1 } }
\fp_gzero_new:c 25711 \cs_new_protected:Npn \fp_gzero_new:N #1
25712 { \fp_if_exist:NTF #1 { \fp_gzero:N #1 } { \fp_new:N #1 } }
25713 \cs_generate_variant:Nn \fp_zero_new:N { c }
25714 \cs_generate_variant:Nn \fp_gzero_new:N { c }

(End of definition for \fp_zero_new:N and \fp_gzero_new:N. These functions are documented on page 266.)

```

75.2 Updating values

These match the equivalent functions in l3int and l3skip.

```

\fp_add:Nn For the sake of error recovery we should not simply set #1 to #1±(#2): for instance, if #2
\fp_add:cn is 0)+2, the parsing error would be raised at the last closing parenthesis rather than at
\fp_gadd:Nn the closing parenthesis in the user argument. Thus we evaluate #2 instead of just putting
\fp_gadd:cn parentheses. As an optimization we use __fp_parse:n rather than \fp_eval:n, which
\fp_sub:Nn would convert the result away from the internal representation and back.
\fp_sub:cn 25715 \cs_new_protected:Npn \fp_add:Nn { __fp_add:NNNn \fp_set:Nn + }
\fp_gsub:Nn 25716 \cs_new_protected:Npn \fp_gadd:Nn { __fp_add:NNNn \fp_gset:Nn + }
\fp_gsub:cn 25717 \cs_new_protected:Npn \fp_sub:Nn { __fp_add:NNNn \fp_set:Nn - }
__fp_add:NNNn 25718 \cs_new_protected:Npn \fp_gsub:Nn { __fp_add:NNNn \fp_gset:Nn - }
25719 \cs_new_protected:Npn __fp_add:NNNn #1#2#3#4
25720 { #1 #3 { #3 #2 __fp_parse:n {#4} } }
25721 \cs_generate_variant:Nn \fp_add:Nn { c }
25722 \cs_generate_variant:Nn \fp_gadd:Nn { c }
25723 \cs_generate_variant:Nn \fp_sub:Nn { c }
25724 \cs_generate_variant:Nn \fp_gsub:Nn { c }

(End of definition for \fp_add:Nn and others. These functions are documented on page 266.)

```

75.3 Showing values

```

\fp_show:N This shows the result of computing its argument by passing the right data to \tl_show:n
\fp_show:c or \tl_log:n.
\fp_log:N 25725 \cs_new_protected:Npn \fp_show:N { __fp_show:NN \tl_show:n }
\fp_log:c 25726 \cs_generate_variant:Nn \fp_show:N { c }
__fp_show:NN 25727 \cs_new_protected:Npn \fp_log:N { __fp_show:NN \tl_log:n }
25728 \cs_generate_variant:Nn \fp_log:N { c }
25729 \cs_new_protected:Npn __fp_show:NN #1#2
25730 {
25731   __kernel_chk_tl_type:NnnT #2 { fp }

```

```

25732     { \exp_args:No \__fp_show_validate:n #2 }
25733     { \exp_args:Ne #1 { \token_to_str:N #2 = \fp_to_tl:N #2 } }
25734   }

```

(End of definition for \fp_show:N, \fp_log:N, and __fp_show:NN. These functions are documented on page 277.)

```

\__fp_show_validate:n
\__fp_show_validate_aux:n
\__fp_show_validate:nn
\__fp_show_validate:w
\__fp_tuple_show_validate:w
\__fp_symbolic_show_validate:w

To support symbolic expression, validation has to be done recursively. Two \@@_show_validate:nn
wrappers are used to distinguish between initial and recursive calls, in which the former
provides a demo of possible forms a fp variable would have.

25735 \cs_new:Npn \__fp_show_validate:n #1

```

(End of definition for __fp_show_validate:n and others.)

\fp_show:n Use general tools.

\fp_log:n

```

25803 \cs_new_protected:Npn \fp_show:n
25804 { \__kernel_msg_show_eval:Nn \fp_to_tl:n }
25805 \cs_new_protected:Npn \fp_log:n
25806 { \__kernel_msg_log_eval:Nn \fp_to_tl:n }

```

(End of definition for \fp_show:n and \fp_log:n. These functions are documented on page 277.)

75.4 Some useful constants and scratch variables

\c_one_fp Some constants.

\c_e_fp

```

25807 \fp_const:Nn \c_e_fp { 2.718 2818 2845 9045 }
25808 \fp_const:Nn \c_one_fp { 1 }

```

(End of definition for \c_one_fp and \c_e_fp. These variables are documented on page 275.)

\c_pi_fp We simply round π to and $\pi/180$ to 16 significant digits.

\c_one_degree_fp

```

25809 \fp_const:Nn \c_pi_fp { 3.141 5926 5358 9793 }
25810 \fp_const:Nn \c_one_degree_fp { 0.0 1745 3292 5199 4330 }

```

(End of definition for \c_pi_fp and \c_one_degree_fp. These variables are documented on page 275.)

\l_tmpa_fp Scratch variables are simply initialized there.

\l_tmpb_fp

```

25811 \fp_new:N \l_tmpa_fp
25812 \fp_new:N \l_tmpb_fp
25813 \fp_new:N \g_tmpa_fp

(End of definition for `\l_tmpa_fp` and others. These variables are documented on page 275.)

25815 `</code>`

Chapter 76

l3fp-logic implementation

25816 $\langle *code \rangle$

25817 $\langle @@=fp \rangle$

$\backslash_fp_parse_word_max:N$
 $\backslash_fp_parse_word_min:N$

Those functions may receive a variable number of arguments.

25818 $\backslash cs_new:Npn \backslash_fp_parse_word_max:N$
25819 $\{ \backslash_fp_parse_function:NNN \backslash_fp_minmax_o:Nw 2 \}$
25820 $\backslash cs_new:Npn \backslash_fp_parse_word_min:N$
25821 $\{ \backslash_fp_parse_function:NNN \backslash_fp_minmax_o:Nw 0 \}$

(End of definition for $\backslash_fp_parse_word_max:N$ and $\backslash_fp_parse_word_min:N$.)

76.1 Syntax of internal functions

- $\backslash_fp_compare_npos:nwnw \{ \langle expo_1 \rangle \} \langle body_1 \rangle \backslash_fp_sep: \{ \langle expo_2 \rangle \} \langle body_2 \rangle \backslash_fp_sep:$
- $\backslash_fp_minmax_o:Nw \langle sign \rangle \langle floating\ point\ array \rangle$
- $\backslash_fp_not_o:w ? \langle floating\ point\ array \rangle$ (with one floating point number only)
- $\backslash_fp_ \& _o:ww \langle floating\ point \rangle \langle floating\ point \rangle$
- $\backslash_fp_| _o:ww \langle floating\ point \rangle \langle floating\ point \rangle$
- $\backslash_fp_ternary:NwwN, \backslash_fp_ternary_auxi:NwwN, \backslash_fp_ternary_auxii:NwwN$ have to be understood.

76.2 Tests

$\backslash fp_if_exist_p:N$
 $\backslash fp_if_exist_p:c$
 $\backslash fp_if_exist:N\textcolor{red}{TF}$
 $\backslash fp_if_exist:c\textcolor{red}{TF}$

Copies of the cs functions defined in l3basics.

25822 $\backslash prg_new_eq_conditional:NNn \backslash fp_if_exist:N \backslash cs_if_exist:N \{ TF, T, F, p \}$
25823 $\backslash prg_new_eq_conditional:NNn \backslash fp_if_exist:c \backslash cs_if_exist:c \{ TF, T, F, p \}$

(End of definition for $\backslash fp_if_exist:N\textcolor{red}{TF}$. This function is documented on page [268](#).)

\fp_if_nan_p:n Evaluate and check if the result is a floating point of the same kind as nan.
\fp_if_nan:nTF

```

25824 \prg_new_conditional:Npnn \fp_if_nan:n #1 { TF , T , F , p }
25825 {
25826   \if:w 3 \exp_last_unbraced:Nf \__fp_kind:w { \__fp_parse:n {#1} }
25827   \prg_return_true:
25828   \else:
25829     \prg_return_false:
25830   \fi:
25831 }

```

(End of definition for \fp_if_nan:nTF. This function is documented on page 270.)

76.3 Comparison

\fp_compare_p:n Within floating point expressions, comparison operators are treated as operations, so we
\fp_compare:nTF evaluate #1, then compare with ± 0 . Tuples are true.

```

\__fp_compare_return:w 25832 \prg_new_conditional:Npnn \fp_compare:n #1 { p , T , F , TF }
25833 {
25834   \exp_after:wN \__fp_compare_return:w
25835   \exp:w \exp_end_continue_f:w \__fp_parse:n {#1}
25836 }
25837 \cs_new:Npn \__fp_compare_return:w #1#2#3\__fp_sep:
25838 {
25839   \if_charcode:w 0
25840     \__fp_if_type_fp:NTwFw
25841     #1 { \__fp_use_i_delimit_by_s_stop:nw #3 \s__fp_stop }
25842     \s__fp 1 \s__fp_stop
25843     \prg_return_false:
25844   \else:
25845     \prg_return_true:
25846   \fi:
25847 }

```

(End of definition for \fp_compare:nTF and __fp_compare_return:w. This function is documented on page 270.)

\fp_compare_p:nNn Evaluate #1 and #3, using an auxiliary to expand both, and feed the two floating point
\fp_compare:nNnTF numbers swapped to __fp_compare_back_any:ww, defined below. Compare the result
 __fp_compare_aux:wn with ‘#2-‘=, which is -1 for $<$, 0 for $=$, 1 for $>$ and 2 for $?$.

```

25848 \prg_new_conditional:Npnn \fp_compare:nNn #1#2#3 { p , T , F , TF }
25849 {
25850   \if_int_compare:w
25851     \exp_after:wN \__fp_compare_aux:wn
25852     \exp:w \exp_end_continue_f:w \__fp_parse:n {#1} {#3}
25853     = \__fp_int_eval:w ‘#2 - ‘= \__fp_int_eval_end:
25854     \prg_return_true:
25855   \else:
25856     \prg_return_false:
25857   \fi:
25858 }
25859 \cs_new:Npn \__fp_compare_aux:wn #1\__fp_sep: #2
25860 {
25861   \exp_after:wN \__fp_compare_back_any:ww

```

```

25862     \exp:w \exp_end_continue_f:w \__fp_parse:n {#2} #1\__fp_sep:
25863 }

```

(End of definition for \fp_compare:nNnTF and __fp_compare_aux:wn. This function is documented on page 269.)

```

\__fp_compare_back:ww      \__fp_compare_back_any:ww <y> \__fp_sep: <x> \__fp_sep:
\__fp_bcmp:ww             Expands (in the same way as \int_eval:n) to -1 if  $x < y$ , 0 if  $x = y$ , 1 if  $x > y$ ,
\__fp_compare_back_any:ww and 2 otherwise (denoted as  $x?y$ ). If either operand is nan, stop the comparison with
\__fp_compare_nan:w       \__fp_compare_nan:w returning 2. If  $x$  is negative, swap the outputs 1 and -1 (i.e.,  $>$ 
                           and  $<$ ); we can henceforth assume that  $x \geq 0$ . If  $y \geq 0$ , and they have the same type,
                           either they are normal and we compare them with \__fp_compare_npos:nwnw, or they
                           are equal. If  $y \geq 0$ , but of a different type, the highest type is a larger number. Finally,
                           if  $y \leq 0$ , then  $x > y$ , unless both are zero.

\__fp_compare_significand:nnnnnnnn \__fp_sep:

```

Within an `\int_value:w ... \exp_stop_f:` construction, this expands to 0 if the two numbers are equal, -1 if the first is smaller, and 1 if the first is bigger. First compare the exponents: the larger one denotes the larger number. If they are equal, we must compare significands. If both the first 8 digits and the next 8 digits coincide, the numbers are equal. If only the first 8 digits coincide, the next 8 decide. Otherwise, the first 8 digits are compared.

```

```

(End of definition for `__fp_compare_npos:nwnw` and `__fp_compare_significand:nnnnnnnn`.)

76.4 Floating point expression loops

These are quite easy given the above functions. The `do_until` and `do_while` versions execute the body, then test. The `until_do` and `while_do` do it the other way round.

```

\fp_do_until:nn
\fp_do_while:nn
\fp_until_do:nn
\fp_while_do:nn
25969 \cs_new:Npn \fp_do_until:nn #1#2
25970 {
25971   #2
25972   \fp_compare:nF {#1}
25973   { \fp_do_until:nn {#1} {#2} }
25974 }
25975 \cs_new:Npn \fp_do_while:nn #1#2
25976 {
25977   #2
25978   \fp_compare:nT {#1}
25979   { \fp_do_while:nn {#1} {#2} }
25980 }
25981 \cs_new:Npn \fp_until_do:nn #1#2
25982 {
25983   \fp_compare:nF {#1}
25984   {
25985     #2

```

```

25986     \fp_until_do:nn {#1} {#2}
25987   }
25988 }
25989 \cs_new:Npn \fp_while_do:nn #1#2
25990 {
25991   \fp_compare:nT {#1}
25992   {
25993     #2
25994     \fp_while_do:nn {#1} {#2}
25995   }
25996 }

```

(End of definition for \fp_do_until:nn and others. These functions are documented on page 271.)

\fp_do_until:nNnn As above but not using the nNn syntax.

```

\fp_do_while:nNnn 25997 \cs_new:Npn \fp_do_until:nNnn #1#2#3#4
\fp_until_do:nNnn 25998 {
\fp_while_do:nNnn 25999   #4
26000   \fp_compare:nNnF {#1} #2 {#3}
26001   { \fp_do_until:nNnn {#1} #2 {#3} {#4} }
26002 }
26003 \cs_new:Npn \fp_do_while:nNnn #1#2#3#4
26004 {
26005   #4
26006   \fp_compare:nNnT {#1} #2 {#3}
26007   { \fp_do_while:nNnn {#1} #2 {#3} {#4} }
26008 }
26009 \cs_new:Npn \fp_until_do:nNnn #1#2#3#4
26010 {
26011   \fp_compare:nNnF {#1} #2 {#3}
26012   {
26013     #4
26014     \fp_until_do:nNnn {#1} #2 {#3} {#4}
26015   }
26016 }
26017 \cs_new:Npn \fp_while_do:nNnn #1#2#3#4
26018 {
26019   \fp_compare:nNnT {#1} #2 {#3}
26020   {
26021     #4
26022     \fp_while_do:nNnn {#1} #2 {#3} {#4}
26023   }
26024 }

```

(End of definition for \fp_do_until:nNnn and others. These functions are documented on page 270.)

\fp_step_function:nnnN The approach here is somewhat similar to \int_step_function:nnnN. There are two
\fp_step_function:nnnc subtleties: we use the internal parser __fp_parse:n to avoid converting back and forth
 __fp_step:wwwN from the internal representation; and (due to rounding) even a non-zero step does not
 __fp_step_fp:wwwN guarantee that the loop counter increases.
 __fp_step:NnnnnN
 __fp_step:NfnnnN

```

26025 \cs_new:Npn \fp_step_function:nnnN #1#2#3
26026 {
26027   \exp_after:wN \__fp_step:wwwN
26028   \exp:w \exp_end_continue_f:w \__fp_parse_o:n {#1}

```

```

26029     \exp:w \exp_end_continue_f:w \__fp_parse_o:n {#2}
26030     \exp:w \exp_end_continue_f:w \__fp_parse:n {#3}
26031 }
26032 \cs_generate_variant:Nn \fp_step_function:nnnN { nnn }

```

Only floating point numbers (not tuples) are allowed arguments. Only “normal” floating points (not ± 0 , $\pm \text{inf}$, nan) can be used as step; if positive, call `__fp_step:NnnnnN` with argument `>` otherwise `<`. This function has one more argument than its integer counterpart, namely the previous value, to catch the case where the loop has made no progress. Conversion to decimal is done just before calling the user’s function.

```

76.5 Extrema

`__fp_minmax_o:Nw`
`__fp_minmax_aux_o:Nw`

First check all operands are floating point numbers. The argument #1 is 2 to find the maximum of an array #2 of floating point numbers, and 0 to find the minimum. We read numbers sequentially, keeping track of the largest (smallest) number found so far. If numbers are equal (for instance ± 0), the first is kept. We append $-\infty$ (∞), for the case of an empty array. Since no number is smaller (larger) than that, this additional item only affects the maximum (minimum) in the case of `max()` and `min()` with no argument. The weird fp-like trailing marker breaks the loop correctly: see the precise definition of `__fp_minmax_loop:Nww`.

```

26122 \cs_new:Npn __fp_minmax_o:Nw #1
26123 {
26124   __fp_parse_function_all_fp_o:fnw
26125   { \token_if_eq_meaning:NNTF 0 #1 { min } { max } }
26126   { __fp_minmax_aux_o:Nw #1 }
26127 }
26128 \cs_new:Npn __fp_minmax_aux_o:Nw #1#2 @
26129 {
26130   \if_meaning:w 0 #1

26138 }

```

(End of definition for `__fp_minmax_o:Nw` and `__fp_minmax_aux_o:Nw`.)

`__fp_minmax_loop:Nww`

The first argument is `-` or `+` to denote the case where the currently largest (smallest) number found (first floating point argument) should be replaced by the new number (second floating point argument). If the new number is `nan`, keep that as the extremum, unless that extremum is already a `nan`. Otherwise, compare the two numbers. If the new number is larger (in the case of `max`) or smaller (in the case of `min`), the test yields `true`, and we keep the second number as a new maximum; otherwise we keep the first number. Then loop.

```

Chapter 77

l3fp-basics implementation

```
26253 <*code>
26254 <@@=fp>
```

The `l3fp-basics` module implements addition, subtraction, multiplication, and division of two floating points, and the absolute value and sign-changing operations on one floating point. All operations implemented in this module yield the outcome of rounding the infinitely precise result of the operation to the nearest floating point.

Some algorithms used below end up being quite similar to some described in “What Every Computer Scientist Should Know About Floating Point Arithmetic”, by David Goldberg, which can be found at <http://cr.yp.to/2005-590/goldberg.pdf>.

Unary functions.

```
\__fp_parse_word_abs:N
\__fp_parse_word_logb:N
\__fp_parse_word_sign:N
\__fp_parse_word_sqrt:N
26255 \cs_new:Npn \__fp_parse_word_abs:N
26256 { \__fp_parse_unary_function:NNN \__fp_set_sign_o:w 0 }
26257 \cs_new:Npn \__fp_parse_word_logb:N
26258 { \__fp_parse_unary_function:NNN \__fp_logb_o:w ? }
26259 \cs_new:Npn \__fp_parse_word_sign:N
26260 { \__fp_parse_unary_function:NNN \__fp_sign_o:w ? }
26261 \cs_new:Npn \__fp_parse_word_sqrt:N
26262 { \__fp_parse_unary_function:NNN \__fp_sqrt_o:w ? }
```

(End of definition for __fp_parse_word_abs:N and others.)

77.1 Addition and subtraction

We define here two functions, `__fp_-_o:ww` and `__fp+_o:ww`, which perform the subtraction and addition of their two floating point operands, and expand the tokens following the result once.

A more obscure function, `__fp_add_big_i_o:wNww`, is used in `l3fp-expo`.

The logic goes as follows:

- `__fp_-_o:ww` calls `__fp+_o:ww` to do the work, with the sign of the second operand flipped;
- `__fp+_o:ww` dispatches depending on the type of floating point, calling specialized auxiliaries;

- in all cases except summing two normal floating point numbers, we return one or the other operands depending on the signs, or detect an invalid operation in the case of $\infty - \infty$;
- for normal floating point numbers, compare the signs;
- to add two floating point numbers of the same sign or of opposite signs, shift the significand of the smaller one to match the bigger one, perform the addition or subtraction of significands, check for a carry, round, and pack using the `__fp-basics_pack_...` functions.

The trickiest part is to round correctly when adding or subtracting normal floating point numbers.

77.1.1 Sign, exponent, and special numbers

`__fp_-_o:ww` The `__fp+_o:ww` auxiliary has a hook: it takes one argument between the first `\s__fp` and `__fp_chk:w`, which is applied to the sign of the second operand. Positioning the hook there means that `__fp+_o:ww` can still perform the sanity check that it was followed by `\s__fp`.

```

26263 \cs_new:cpe { __fp_-_o:ww } \s__fp
26264 {
26265   \exp_not:c { __fp+_o:ww }
26266   \exp_not:n { \s__fp \__fp_neg_sign:N }
26267 }
```

(End of definition for `__fp_-_o:ww`.)

`__fp+_o:ww` This function is either called directly with an empty #1 to compute an addition, or it is called by `__fp_-_o:ww` with `__fp_neg_sign:N` as #1 to compute a subtraction, in which case the second operand's sign should be changed. If the `<types>` #2 and #4 are the same, dispatch to case #2 (0, 1, 2, or 3), where we call specialized functions: thanks to `\int_value:w`, those receive the tweaked `<sign2>` (expansion of #1#5) as an argument. If the `<types>` are distinct, the result is simply the floating point number with the highest `<type>`. Since case 3 (used for two nan) also picks the first operand, we can also use it when `<type1>` is greater than `<type2>`. Also note that we don't need to worry about `<sign2>` in that case since the second operand is discarded.

```

26268 \cs_new:cpn { __fp+_o:ww }
26269   \s__fp #1 \__fp_chk:w #2 #3 \__fp_sep: \s__fp \__fp_chk:w #4 #5
26270 {

77.1.2 Absolute addition

In this subsection, we perform the addition of two positive normal numbers.

```

__fp_add_npos_o:NnwNnw      __fp_add_npos_o:NnwNnw <sign1> <exp1> <body1> \__fp_sep: \s__fp \__fp_-
                             chk:w 1 <initial sign2> <exp2> <body2> \__fp_sep:

```

Since we are doing an addition, the final sign is $\langle sign_1 \rangle$. Start an `__fp_int_eval:w`, responsible for computing the exponent: the result, and the $\langle final\ sign \rangle$ are then given to `__fp_sanitize:Nw` which checks for overflow. The exponent is computed as the largest exponent #2 or #5, incremented if there is a carry. To add the significands, we decimate the smaller number by the difference between the exponents. This is done by `__fp_add_big_i:wNww` or `__fp_add_big_ii:wNww`. We need to bring the final sign with us in the midst of the calculation to round properly at the end.

```

```

To round properly, we must know at which digit the rounding should occur. This requires to know whether the addition produces an overall carry or not. Thus, we do the computation now and check for a carry, then go back and do the rounding. The rounding may cause a carry in very rare cases such as $0.99\dots95 \rightarrow 1.00\dots0$, but this situation always give an exact power of 10, for which it is easy to correct the result at the end.

_fp_sub_npos_i_o:Nnnnw After the computation is done, _fp_sanitize:Nw checks for overflow/underflow. It expects the *final sign* and the *exponent* (delimited by _fp_sep:). Start an integer expression for the exponent, which starts with the exponent of the largest number, and may be decreased if the two numbers are very close. If the two numbers have the same exponent, call the *near* auxiliary. Otherwise, decimate *y*, then call the *far* auxiliary to evaluate the difference between the two significands. Note that we decimate by 1 less than one could expect.

```

26425   \cs_new:Npn \_fp_sub_npos_i_o:Nnnnw #1 #2#3\_fp_sep: #4#5\_fp_sep:

```

This function is called with $\langle Z_1 \rangle \leq 999$. Act with `\number` to trim leading zeros from $\langle Z_1 \rangle$ $\langle Z_2 \rangle$ (we don't do all four blocks at once, since non-zero blocks would then overflow \TeX 's integers). If the first two blocks are zero, the auxiliary receives an empty `#1` and trims `#2#30` from leading zeros, yielding a total shift between 7 and 16 to the exponent. Otherwise we get the shift from `#1` alone, yielding a result between 1 and 6. Once the exponent is taken care of, trim leading zeros from `#1#2#3` (when `#1` is empty, the space before `#2#3` is ignored), get four blocks of 4 digits and finally clean up. Trailing zeros are added so that digits can be grabbed safely.

`__fp_sub_back_quite_far_o:wwNN`
`__fp_sub_back_quite_far_ii:NN`

The easiest case is when $x - y$ is extremely close to a power of 10, namely the first digit of x is 1, and all others vanish when subtracting y . Then the `\langle rounding \rangle #3` and the `\langle final sign \rangle #4` control whether we get 1 or 0.9999999999999999. In the usual round-to-nearest mode, we get 1 whenever the `\langle rounding \rangle` digit is less than or equal to 5 (remember that the `\langle rounding \rangle` digit is only equal to 5 if there was no further non-zero digit).

(End of definition for `__fp_sub_back_quite_far_o:wwNN` and `__fp_sub_back_quite_far_ii:NN`.)

`__fp_sub_back_not_far_o:wwwNN`

In the present case, x and y have different exponents, but y is large enough that $x - y$ has a smaller exponent than x . Decrement the exponent (with `-1`). Then proceed in a way

similar to the `near` auxiliaries seen earlier, but multiplying x by 10 (#30 and #40 below), and with the added quirk that the *rounding* digit has to be taken into account. Namely, we may have to decrease the result by one unit if `__fp_round_neg:NNN` returns 1. This function expects the *final sign* #6, the last digit of `1100000000+#40-#2`, and the *rounding* digit. Instead of redoing the computation for the second argument, we note that `__fp_round_neg:NNN` only cares about its parity, which is identical to that of the last digit of #2.

```

`__fp_sub_back_very_far_o:wwwNN`
`__fp_sub_back_very_far_ii_o:nnNwNN`

The case where $x - y$ and x have the same exponent is a bit more tricky, mostly because it cannot reuse the same auxiliaries. Shift the y significand by adding a leading 0. Then the logic is similar to the `not_far` functions above. Rounding is a bit more complicated: we have two *rounding* digits #3 and #6 (from the decimation, and from the new shift) to take into account, and getting the parity of the main result requires a computation. The first `\int_value:w` triggers the second one because the number is unfinished; we can thus not use 0 in place of 2 there.

```

77.2 Multiplication

77.2.1 Signs, and special numbers

`__fp*_o:ww` We go through an auxiliary, which is common with `__fp/_o:ww`. The first argument is the operation, used for the invalid operation exception. The second is inserted in a formula to dispatch cases slightly differently between multiplication and division. The third is the operation for normal floating points. The fourth is there for extra cases needed in `__fp/_o:ww`.

```

26552 \cs_new:cpn { __fp*_o:ww }
26553 {
26554   \__fp_mul_cases_o:NnNnw
26555   *
26556   { - 2 + }
26557   \__fp_mul_npos_o:Nww
26558   { }
26559 }
```

(End of definition for `__fp*_o:ww`.)

`__fp_mul_cases_o:NnNnw` Split into 10 cases (12 for division). If both numbers are normal, go to case 0 (same sign) or case 1 (opposite signs): in both cases, call `__fp_mul_npos_o:Nww` to do the work. If the first operand is `nan`, go to case 2, in which the second operand is discarded; if the second operand is `nan`, go to case 3, in which the first operand is discarded (note the weird interaction with the final test on signs). Then we separate the case where the first number is normal and the second is zero: this goes to cases 4 and 5 for multiplication, 10 and 11 for division. Otherwise, we do a computation which dispatches the products $0 \times 0 = 0 \times 1 = 1 \times 0 = 0$ to case 4 or 5 depending on the combined sign, the products $0 \times \infty$ and $\infty \times 0$ to case 6 or 7 (invalid operation), and the products $1 \times \infty = \infty \times 1 = \infty \times \infty = \infty$ to cases 8 and 9. Note that the code for these two cases (which return $\pm\infty$) is inserted as argument #4, because it differs in the case of divisions.

77.2.2 Absolute multiplication

In this subsection, we perform the multiplication of two positive normal numbers.

```

\__fp_mul_npos_o:Nww \__fp_mul_npos_o:Nww <final sign> \s__fp \__fp_chk:w 1 <sign1> {<exp1>}
<body1> \__fp_sep: \s__fp \__fp_chk:w 1 <sign2> {<exp2>} <body2> \__fp_-
sep:

```

After the computation, __fp_sanitize:Nw checks for overflow or underflow. As we did for addition, __fp_int_eval:w computes the exponent, catching any shift coming from the computation in the significand. The <final sign> is needed to do the rounding properly in the significand computation. We setup the post-expansion here, triggered by __fp_mul_significand_o:nnnnNnnnn.

This is also used in l3fp-convert.

```

26598 \cs_new:Npn \__fp_mul_npos_o:Nww
26599     #1 \s__fp \__fp_chk:w #2 #3 #4 #5 \__fp_sep:
26600     \s__fp \__fp_chk:w #6 #7 #8 #9 \__fp_sep:
26601 {
26602     \exp_after:wN \__fp_sanitize:Nw
26603     \exp_after:wN #1
26604     \int_value:w \__fp_int_eval:w
26605     #4 + #8
26606     \__fp_mul_significand_o:nnnnNnnnn #5 #1 #9
26607 }

```

(End of definition for __fp_mul_npos_o:Nww.)

```

\__fp_mul_significand_o:nnnnNnnnn \__fp_mul_significand_o:nnnnNnnnn {<X1>} {<X2>} {<X3>} {<X4>} <sign>
\__fp_mul_significand_drop:NNNNNw {<Y1>} {<Y2>} {<Y3>} {<Y4>}
\__fp_mul_significand_keep:NNNNNw

```

Note the three __fp_sep:s at the end of the definition. One is for the last __fp_mul_significand_drop:NNNNNw; one is for __fp_round_digit:Nw later on; and one, preceded by \exp_after:wN, which is correctly expanded (within an __fp_int_eval:w), is used by __fp_basics_pack_low:NNNNNw.

The product of two 16 digit integers has 31 or 32 digits, but it is impossible to know which one before computing. The place where we round depends on that number

of digits, and may depend on all digits until the last in some rare cases. The approach is thus to compute the 5 first blocks of 4 digits (the first one is between 100 and 9999 inclusive), and a compact version of the remaining 3 blocks. Afterwards, the number of digits is known, and we can do the rounding within yet another set of `__fp_int_eval:w`.

(End of definition for `__fp_mul_significand_small_f:NNwwN`.)

77.3 Division

77.3.1 Signs, and special numbers

Time is now ripe to tackle the hardest of the four elementary operations: division.

`__fp/_o:ww`

Filtering special floating point is very similar to what we did for multiplications, with a few variations. Invalid operation exceptions display / rather than *. In the formula for dispatch, we replace - 2 + by -. The case of normal numbers is treated using `__fp_div_npos_o:Nww` rather than `__fp_mul_npos_o:Nww`. There are two additional cases: if the first operand is normal and the second is a zero, then the division by zero exception is raised: cases 10 and 11 of the `\if_case:w` construction in `__fp_mul_cases_o:NnNww` are provided as the fourth argument here.

```

26667 \cs_new:cpn { __fp/_o:ww }
26668   {

```

```

26669 \__fp_mul_cases_o:NnNnw
26670 /
26671 { - }
26672 \__fp_div_npos_o:Nww
26673 {
26674   \or:
26675   \__fp_case_use:nw
26676   { \__fp_division_by_zero_o:NNww \c_inf_fp / }
26677   \or:
26678   \__fp_case_use:nw
26679   { \__fp_division_by_zero_o:NNww \c_minus_inf_fp / }
26680 }
26681 }

```

(End of definition for __fp/_o:ww.)

```

\__fp_div_npos_o:Nww \__fp_div_npos_o:Nww <final sign> \s__fp \__fp_chk:w 1 <sign_A> {\exp
A}& \{A_1\} \{A_2\} \{A_3\} \{A_4\} \__fp_sep: \s__fp \__fp_chk:w 1
<sign_Z> {\exp Z}& \{Z_1\} \{Z_2\} \{Z_3\} \{Z_4\} \__fp_sep:

```

We want to compute A/Z . As for multiplication, `__fp_sanitize:Nw` checks for overflow or underflow; we provide it with the `<final sign>`, and an integer expression in which we compute the exponent. We set up the arguments of `__fp_div_significand_i_o:wnnw`, namely an integer $\langle y \rangle$ obtained by adding 1 to the first 5 digits of Z (explanation given soon below), then the four $\{A_i\}$, then the four $\{Z_i\}$, a `__fp_sep:`, and the `<final sign>`, used for rounding at the end.

```

26682 \cs_new:Npn \__fp_div_npos_o:Nww
26683   #1 \s__fp \__fp_chk:w 1 #2 #3 #4 \__fp_sep:

26692     #4
26693     {\#7}{\#8}\#9 \__fp_sep:
26694     #1
26695   }

```

(End of definition for __fp_div_npos_o:Nww.)

77.3.2 Work plan

In this subsection, we explain how to avoid overflowing $\text{T}_{\text{E}}\text{X}$'s integers when performing the division of two positive normal numbers.

We are given two numbers, $A = 0.A_1A_2A_3A_4$ and $Z = 0.Z_1Z_2Z_3Z_4$, in blocks of 4 digits, and we know that the first digits of A_1 and of Z_1 are non-zero. To compute A/Z , we proceed as follows.

- Find an integer $Q_A \simeq 10^4 A/Z$.
- Replace A by $B = 10^4 A - Q_A Z$.

- Find an integer $Q_B \simeq 10^4 B/Z$.
- Replace B by $C = 10^4 B - Q_B Z$.
- Find an integer $Q_C \simeq 10^4 C/Z$.
- Replace C by $D = 10^4 C - Q_C Z$.
- Find an integer $Q_D \simeq 10^4 D/Z$.
- Consider $E = 10^4 D - Q_D Z$, and ensure correct rounding.

The result is then $Q = 10^{-4}Q_A + 10^{-8}Q_B + 10^{-12}Q_C + 10^{-16}Q_D + \text{rounding}$. Since the Q_i are integers, B , C , D , and E are all exact multiples of 10^{-16} , in other words, computing with 16 digits after the decimal separator yields exact results. The problem is the risk of overflow: in general B , C , D , and E may be greater than 1.

Unfortunately, things are not as easy as they seem. In particular, we want all intermediate steps to be positive, since negative results would require extra calculations at the end. This requires that $Q_A \leq 10^4 A/Z$ etc. A reasonable attempt would be to define Q_A as

$$\backslash\text{int_eval:n}\left\{\frac{A_1 A_2}{Z_1 + 1} - 1\right\} \leq 10^4 \frac{A}{Z}$$

Subtracting 1 at the end takes care of the fact that $\varepsilon\text{-TeX}$'s `__fp_int_eval:w` rounds divisions instead of truncating (really, $1/2$ would be sufficient, but we work with integers). We add 1 to Z_1 because $Z_1 \leq 10^4 Z < Z_1 + 1$ and we need Q_A to be an underestimate. However, we are now underestimating Q_A too much: it can be wrong by up to 100, for instance when $Z = 0.1$ and $A \simeq 1$. Then B could take values up to 10 (maybe more), and a few steps down the line, we would run into arithmetic overflow, since TeX can only handle integers less than roughly $2 \cdot 10^9$.

A better formula is to take

$$Q_A = \backslash\text{int_eval:n}\left\{\frac{10 \cdot A_1 A_2}{\lfloor 10^{-3} \cdot Z_1 Z_2 \rfloor + 1} - 1\right\}.$$

This is always less than $10^9 A/(10^5 Z)$, as we wanted. In words, we take the 5 first digits of Z into account, and the 8 first digits of A , using 0 as a 9-th digit rather than the true digit for efficiency reasons. We shall prove that using this formula to define all the Q_i avoids any overflow. For convenience, let us denote

$$y = \lfloor 10^{-3} \cdot Z_1 Z_2 \rfloor + 1,$$

so that, taking into account the fact that $\varepsilon\text{-TeX}$ rounds ties away from zero,

$$\begin{aligned} Q_A &= \left\lfloor \frac{A_1 A_2 0}{y} - \frac{1}{2} \right\rfloor \\ &> \frac{A_1 A_2 0}{y} - \frac{3}{2}. \end{aligned}$$

Note that $10^4 < y \leq 10^5$, and $999 \leq Q_A \leq 99989$. Also note that this formula does not cause an overflow as long as $A < (2^{31} - 1)/10^9 \simeq 2.147 \dots$, since the numerator involves an integer slightly smaller than $10^9 A$.

Let us bound B :

$$\begin{aligned}
10^5 B &= A_1 A_2 0 + 10 \cdot 0 \cdot A_3 A_4 - 10 \cdot Z_1 \cdot Z_2 Z_3 Z_4 \cdot Q_A \\
&< A_1 A_2 0 \cdot \left(1 - 10 \cdot \frac{Z_1 \cdot Z_2 Z_3 Z_4}{y}\right) + \frac{3}{2} \cdot 10 \cdot Z_1 \cdot Z_2 Z_3 Z_4 + 10 \\
&\leq \frac{A_1 A_2 0 \cdot (y - 10 \cdot Z_1 \cdot Z_2 Z_3 Z_4)}{y} + \frac{3}{2} y + 10 \\
&\leq \frac{A_1 A_2 0 \cdot 1}{y} + \frac{3}{2} y + 10 \leq \frac{10^9 A}{y} + 1.6 \cdot y.
\end{aligned}$$

At the last step, we hide 10 into the second term for later convenience. The same reasoning yields

$$\begin{aligned}
10^5 B &< 10^9 A/y + 1.6y, \\
10^5 C &< 10^9 B/y + 1.6y, \\
10^5 D &< 10^9 C/y + 1.6y, \\
10^5 E &< 10^9 D/y + 1.6y.
\end{aligned}$$

The goal is now to prove that none of B , C , D , and E can go beyond $(2^{31} - 1)/10^9 = 2.147 \dots$.

Combining the various inequalities together with $A < 1$, we get

$$\begin{aligned}
10^5 B &< 10^9/y + 1.6y, \\
10^5 C &< 10^{13}/y^2 + 1.6(y + 10^4), \\
10^5 D &< 10^{17}/y^3 + 1.6(y + 10^4 + 10^8/y), \\
10^5 E &< 10^{21}/y^4 + 1.6(y + 10^4 + 10^8/y + 10^{12}/y^2).
\end{aligned}$$

All of those bounds are convex functions of y (since every power of y involved is convex, and the coefficients are positive), and thus maximal at one of the end-points of the allowed range $10^4 < y \leq 10^5$. Thus,

$$\begin{aligned}
10^5 B &< \max(1.16 \cdot 10^5, 1.7 \cdot 10^5), \\
10^5 C &< \max(1.32 \cdot 10^5, 1.77 \cdot 10^5), \\
10^5 D &< \max(1.48 \cdot 10^5, 1.777 \cdot 10^5), \\
10^5 E &< \max(1.64 \cdot 10^5, 1.7777 \cdot 10^5).
\end{aligned}$$

All of those bounds are less than $2.147 \cdot 10^5$, and we are thus within $\text{T}_{\text{E}}\text{X}$'s bounds in all cases!

We later need to have a bound on the Q_i . Their definitions imply that $Q_A < 10^9 A/y - 1/2 < 10^5 A$ and similarly for the other Q_i . Thus, all of them are less than 177770.

The last step is to ensure correct rounding. We have

$$A/Z = \sum_{i=1}^4 (10^{-4i} Q_i) + 10^{-16} E/Z$$

exactly. Furthermore, we know that the result is in $[0.1, 10)$, hence will be rounded to a multiple of 10^{-16} or of 10^{-15} , so we only need to know the integer part of E/Z , and a “rounding” digit encoding the rest. Equivalently, we need to find the integer part of $2E/Z$, and determine whether it was an exact integer or not (this serves to detect ties). Since

$$\frac{2E}{Z} = 2 \frac{10^5 E}{10^5 Z} \leq 2 \frac{10^5 E}{10^4} < 36,$$

this integer part is between 0 and 35 inclusive. We let ε -TeX round

$$P = \text{\texttt{\textbackslash int_eval:n}} \left\{ \frac{2 \cdot E_1 E_2}{Z_1 Z_2} \right\},$$

which differs from $2E/Z$ by at most

$$\frac{1}{2} + 2 \left| \frac{E}{Z} - \frac{E}{10^{-8} Z_1 Z_2} \right| + 2 \left| \frac{10^8 E - E_1 E_2}{Z_1 Z_2} \right| < 1,$$

($1/2$ comes from ε -TeX’s rounding) because each absolute value is less than 10^{-7} . Thus P is either the correct integer part, or is off by 1; furthermore, if $2E/Z$ is an integer, $P = 2E/Z$. We will check the sign of $2E - PZ$. If it is negative, then $E/Z \in ((P-1)/2, P/2)$. If it is zero, then $E/Z = P/2$. If it is positive, then $E/Z \in (P/2, (P+1)/2)$. In each case, we know how to round to an integer, depending on the parity of P , and the rounding mode.

77.3.3 Implementing the significand division

`_fp_div_significand_i_o:wnnw`

`_fp_div_significand_i_o:wnnw <y> _fp_sep: {<A1>} {<A2>} {<A3>} {<A4>} {<Z1>} {<Z2>} {<Z3>} {<Z4>} _fp_sep: <sign>`

Compute $10^6 + Q_A$ (a 7 digit number thanks to the shift), unbrace $\langle A_1 \rangle$ and $\langle A_2 \rangle$, and prepare the $\langle continuation \rangle$ arguments for 4 consecutive calls to `_fp_div_significand_calc:wnnnnnnnn`. Each of these calls needs $\langle y \rangle$ (#1), and it turns out that we need post-expansion there, hence the `\int_value:w`. Here, #4 is six brace groups, which give the six first n-type arguments of the `calc` function.

`_fp_div_significand_calc:wnnnnnnnn`
`_fp_div_significand_calc_i:wnnnnnnnn`
`_fp_div_significand_calc_ii:wnnnnnnnn`

`_fp_div_significand_calc:wnnnnnnnn <106 + QA> _fp_sep: <A1> <A2>`
`_fp_sep: {<A3>} {<A4>} {<Z1>} {<Z2>} {<Z3>} {<Z4>} {<continuation>}`
 expands to

$$\langle 10^6 + Q_A \rangle \langle continuation \rangle \backslash_fp_sep: \langle B_1 \rangle \langle B_2 \rangle \backslash_fp_sep: \{\langle B_3 \rangle\} \{\langle B_4 \rangle\} \\ \{\langle Z_1 \rangle\} \{\langle Z_2 \rangle\} \{\langle Z_3 \rangle\} \{\langle Z_4 \rangle\}$$

where $B = 10^4 A - Q_A \cdot Z$. This function is also used to compute C , D , E (with the input shifted accordingly), and is used in `l3fp-expo`.

We know that $0 < Q_A < 1.8 \cdot 10^5$, so the product of Q_A with each Z_i is within $\text{T}_{\text{E}}\text{X}$'s bounds. However, it is a little bit too large for our purposes: we would not be able to use the usual trick of adding a large power of 10 to ensure that the number of digits is fixed.

The bound on Q_A , implies that $10^6 + Q_A$ starts with the digit 1, followed by 0 or 1. We test, and call different auxiliaries for the two cases. An earlier implementation did the tests within the computation, but since we added a `\langle continuation \rangle`, this is not possible because the macro has 9 parameters.

The result we want is then (the overall power of 10 is arbitrary):

$$10^{-4}(\#2 - \#1 \cdot \#5 - 10 \cdot \langle i \rangle \cdot \#5\#6) + 10^{-8}(\#3 - \#1 \cdot \#6 - 10 \cdot \langle i \rangle \cdot \#7) \\ + 10^{-12}(\#4 - \#1 \cdot \#7 - 10 \cdot \langle i \rangle \cdot \#8) + 10^{-16}(-\#1 \cdot \#8),$$

where $\langle i \rangle$ stands for the 10^5 digit of Q_A , which is 0 or 1, and $\#1$, $\#2$, *etc.* are the parameters of either auxiliary. The factors of 10 come from the fact that $Q_A = 10 \cdot 10^4 \cdot \langle i \rangle + \#1$. As usual, to combine all the terms, we need to choose some shifts which must ensure that the number of digits of the second, third, and fourth terms are each fixed. Here, the positive contributions are at most 10^8 and the negative contributions can go up to 10^9 . Indeed, for the auxiliary with $\langle i \rangle = 1$, $\#1$ is at most 80000, leading to contributions of at worse $-8 \cdot 10^8$, while the other negative term is very small $< 10^6$ (except in the first expression, where we don't care about the number of digits); for the auxiliary with $\langle i \rangle = 0$, $\#1$ can go up to 99999, but there is no other negative term. Hence, a good choice is $2 \cdot 10^9$, which produces totals in the range $[10^9, 2.1 \cdot 10^9]$. We are flirting with $\text{T}_{\text{E}}\text{X}$'s limits once more.

```

This adds to the current expression $(10^7 + 10 \cdot Q_D)$ a contribution of $5 \cdot P + \text{sign}(T)$ with $T = 2E - PZ$. This amounts to adding $P/2$ to Q_D , with an extra *rounding* digit. This *rounding* digit is 0 or 5 if T does not contribute, i.e., if $0 = T = 2E - PZ$, in other words if $10^{16}A/Z$ is an integer or half-integer. Otherwise it is in the appropriate range, $[1, 4]$ or $[6, 9]$. This is precise enough for rounding purposes (in any mode).

It seems an overkill to compute T exactly as I do here, but I see no faster way right now.

Once more, we need to be careful and show that the calculation $\#1 \cdot \#6\#7$ below does not cause an overflow: naively, P can be up to 35, and $\#6\#7$ up to 10^8 , but both cannot happen simultaneously. To show that things are fine, we split in two (non-disjoint) cases.

- For $P < 10$, the product obeys $P \cdot \#6\#7 < 10^8 \cdot P < 10^9$.
- For large $P \geq 3$, the rounding error on P , which is at most 1, is less than a factor of 2, hence $P \leq 4E/Z$. Also, $\#6\#7 \leq 10^8 \cdot Z$, hence $P \cdot \#6\#7 \leq 4E \cdot 10^8 < 10^9$.

Both inequalities could be made tighter if needed.

Note however that $P \cdot \#8\#9$ may overflow, since the two factors are now independent, and the result may reach $3.5 \cdot 10^9$. Thus we compute the two lower levels separately. The rest is standard, except that we use $+$ as a separator (ending integer expressions explicitly). T is negative if the first character is $-$, it is positive if the first character is neither 0 nor $-$. It is also positive if the first character is 0 and second argument of `_fp_div_significand_vi:Nw`, a sum of several terms, is also zero. Otherwise, there was an exact agreement: $T = 0$.

```

(End of definition for `__fp_div_significand_iv:wwnnnnnnn`, `__fp_div_significand_v:NNw`, and `__fp_div_significand_vi:Nw`.)

`__fp_div_significand_pack:NNN` At this stage, we are in the following situation: $\text{T}_{\text{E}}\text{X}$ is in the process of expanding several integer expressions, thus functions at the bottom expand before those above.

```
\__fp_div_significand_test_o:w 10^6 + Q_A \__fp_div_significand_-
pack:NNN 10^6 + Q_B \__fp_div_significand_pack:NNN 10^6 + Q_C \__fp_-
div_significand_pack:NNN 10^7 + 10 \cdot Q_D + 5 \cdot P + \varepsilon \__fp_sep: \langle sign \rangle
```

Here, $\varepsilon = \text{sign}(T)$ is 0 in case $2E = PZ$, 1 in case $2E > PZ$, which means that P was the correct value, but not with an exact quotient, and -1 if $2E < PZ$, i.e., P was an overestimate. The packing function we define now does nothing special: it removes the 10^6 and carries two digits (for the 10^5 's and the 10^4 's).

```
26790 \cs_new:Npn \__fp_div_significand_pack:NNN 1 #1 #2 { + #1 #2 \__fp_sep: }
```

(End of definition for `__fp_div_significand_pack:NNN`.)

```
\__fp_div_significand_test_o:w \__fp_div_significand_test_o:w 10 \langle 5d \rangle \__fp_sep: \langle 4d \rangle \__fp_sep:
\langle 4d \rangle \__fp_sep: \langle 5d \rangle \__fp_sep: \langle sign \rangle
```

The reason we know that the first two digits are 1 and 0 is that the final result is known to be between 0.1 (inclusive) and 10, hence \widetilde{Q}_A (the tilde denoting the contribution from the other Q_i) is at most 99999, and $10^6 + \widetilde{Q}_A = 10 \dots$.

It is now time to round. This depends on how many digits the final result will have.

_fp_sqrt_npos_o:w

Prepare _fp_sanitize:Nw to receive the final sign 0 (the result is always positive) and the exponent, equal to half of the exponent #1 of the argument. If the exponent #1 is even, find a first approximation of the square root of the significand $10^8 a_1 + a_2 = 10^8 \#2\#3 + \#4\#5$ through Newton's method, starting at $x = 57234133 \simeq 10^{7.75}$. Otherwise, first shift the significand of the argument by one digit, getting $a'_1 \in [10^6, 10^7)$ instead of $[10^7, 10^8)$, then use Newton's method starting at $17782794 \simeq 10^{7.25}$.

(End of definition for $_fp_sqrt_npos_o:w$, $_fp_sqrt_npos_auxi_o:wwnnN$, and $_fp_sqrt_npos_auxii_o:wnnnnnnnN$.)

$_fp_sqrt_Newton_o:wnn$ Newton's method maps $x \mapsto [(x + [10^8 a_1/x])/2]$ in each iteration, where $[b/c]$ denotes $\varepsilon\text{-TeX}$'s division. This division rounds the real number b/c to the closest integer, rounding ties away from zero, hence when c is even, $b/c - 1/2 + 1/c \leq [b/c] \leq b/c + 1/2$ and when c is odd, $b/c - 1/2 + 1/(2c) \leq [b/c] \leq b/c + 1/2 - 1/(2c)$. For all c , $b/c - 1/2 + 1/(2c) \leq [b/c] \leq b/c + 1/2$.

Let us prove that the method converges when implemented with $\varepsilon\text{-TeX}$ integer division, for any $10^6 \leq a_1 < 10^8$ and starting value $10^6 \leq x < 10^8$. Using the inequalities above and the arithmetic-geometric inequality $(x + t)/2 \geq \sqrt{xt}$ for $t = 10^8 a_1/x$, we find

$$x' = \left\lceil \frac{x + [10^8 a_1/x]}{2} \right\rceil \geq \frac{x + 10^8 a_1/x - 1/2 + 1/(2x)}{2} \geq \sqrt{10^8 a_1} - \frac{1}{4} + \frac{1}{4x}.$$

After any step of iteration, we thus have $\delta = x - \sqrt{10^8 a_1} \geq -0.25 + 0.25 \cdot 10^{-8}$. The new difference $\delta' = x' - \sqrt{10^8 a_1}$ after one step is bounded above as

$$x' - \sqrt{10^8 a_1} \leq \frac{x + 10^8 a_1/x + 1/2}{2} + \frac{1}{2} - \sqrt{10^8 a_1} \leq \frac{\delta}{2} \frac{\delta}{\sqrt{10^8 a_1} + \delta} + \frac{3}{4}.$$

For $\delta > 3/2$, this last expression is $\leq \delta/2 + 3/4 < \delta$, hence δ decreases at each step: since all x are integers, δ must reach a value $-1/4 < \delta \leq 3/2$. In this range of values, we get $\delta' \leq \frac{3}{4} \frac{3}{2\sqrt{10^8 a_1}} + \frac{3}{4} \leq 0.75 + 1.125 \cdot 10^{-7}$. We deduce that the difference $\delta = x - \sqrt{10^8 a_1}$ eventually reaches a value in the interval $[-0.25 + 0.25 \cdot 10^{-8}, 0.75 + 1.125 \cdot 10^{-8}]$, whose width is $1 + 11 \cdot 10^{-8}$. The corresponding interval for x may contain two integers, hence x might oscillate between those two values.

However, the fact that $x \mapsto x - 1$ and $x - 1 \mapsto x$ puts stronger constraints, which are not compatible: the first implies

$$x + [10^8 a_1/x] \leq 2x - 2$$

hence $10^8 a_1/x \leq x - 3/2$, while the second implies

$$x - 1 + [10^8 a_1/(x - 1)] \geq 2x - 1$$

hence $10^8 a_1/(x - 1) \geq x - 1/2$. Combining the two inequalities yields $x^2 - 3x/2 \geq 10^8 a_1 \geq x - 3x/2 + 1/2$, which cannot hold. Therefore, the iteration always converges

to a single integer x . To stop the iteration when two consecutive results are equal, the function `_fp_sqrt_Newton_o:wnn` receives the newly computed result as `#1`, the previous result as `#2`, and a_1 as `#3`. Note that ε -TeX combines the computation of a multiplication and a following division, thus avoiding overflow in `#3 * 100000000 / #1`. In any case, the result is within $[10^7, 10^8]$.

`_fp_sqrt_auxi_o:NNNNwnnnN`

This function is followed by $10^8 + x - 1$, which has 9 digits starting with 1, then `_fp_sep: {⟨ a_1 ⟩} {⟨ a_2 ⟩} { a' }`. Here, $x \simeq \sqrt{10^8 a_1}$ and we want to estimate the square root of $a = 10^{-8}a_1 + 10^{-16}a_2 + 10^{-17}a'$. We set up an initial underestimate

$$y = (x - 1)10^{-8} + 0.2499998875 \cdot 10^{-8} \lesssim \sqrt{a}.$$

From the inequalities shown earlier, we know that $y \leq \sqrt{10^{-8}a_1} \leq \sqrt{a}$ and that $\sqrt{10^{-8}a_1} \leq y + 10^{-8} + 11 \cdot 10^{-16}$ hence (using $0.1 \leq y \leq \sqrt{a} \leq 1$)

$$a - y^2 \leq 10^{-8}a_1 + 10^{-8} - y^2 \leq (y + 10^{-8} + 11 \cdot 10^{-16})^2 - y^2 + 10^{-8} < 3.2 \cdot 10^{-8},$$

and $\sqrt{a} - y = (a - y^2)/(\sqrt{a} + y) \leq 16 \cdot 10^{-8}$. Next, `_fp_sqrt_auxii_o:NnnnnnnnnN` is called several times to get closer and closer underestimates of \sqrt{a} . By construction, the underestimates y are always increasing, $a - y^2 < 3.2 \cdot 10^{-8}$ for all. Also, $y < 1$.

```

(End of definition for `_fp_sqrt_auxi_o:NNNNwnnnN`.)

`_fp_sqrt_auxii_o:NnnnnnnnnN`

This receives a continuation function `#1`, then five blocks of 4 digits for y , then two 8-digit blocks and a single digit for a . A common estimate of $\sqrt{a} - y = (a - y^2)/(\sqrt{a} + y)$ is $(a - y^2)/(2y)$, which leads to alternating overestimates and underestimates. We tweak this, to only work with underestimates (no need then to worry about signs in the computation). Each step finds the largest integer $j \leq 6$ such that $10^{4j}(a - y^2) < 2 \cdot 10^8$, then computes the integer (with ε -TeX's rounding division)

$$10^{4j}z = \left[([10^{4j}(a - y^2)] - 257) \cdot (0.5 \cdot 10^8) \Big/ [10^8 y + 1] \right].$$

The choice of j ensures that $10^{4j}z < 2 \cdot 10^8 \cdot 0.5 \cdot 10^8 / 10^7 = 10^9$, thus $10^9 + 10^{4j}z$ has exactly 10 digits, does not overflow TeX's integer range, and starts with 1. Incidentally, since all $a - y^2 \leq 3.2 \cdot 10^{-8}$, we know that $j \geq 3$.

Let us show that z is an underestimate of $\sqrt{a}-y$. On the one hand, $\sqrt{a}-y \leq 16 \cdot 10^{-8}$ because this holds for the initial y and values of y can only increase. On the other hand, the choice of j implies that $\sqrt{a}-y \leq 5(\sqrt{a}+y)(\sqrt{a}-y) = 5(a-y^2) < 10^{9-4j}$. For $j = 3$, the first bound is better, while for larger j , the second bound is better. For all $j \in [3, 6]$, we find $\sqrt{a}-y < 16 \cdot 10^{-2j}$. From this, we deduce that

$$10^{4j}(\sqrt{a}-y) = \frac{10^{4j}(a-y^2-(\sqrt{a}-y)^2)}{2y} \geq \frac{\lfloor 10^{4j}(a-y^2) \rfloor - 257}{2 \cdot 10^{-8} \lfloor 10^8 y + 1 \rfloor} + \frac{1}{2}$$

where we have replaced the bound $10^{4j}(16 \cdot 10^{-2j}) = 256$ by 257 and extracted the corresponding term $1/(2 \cdot 10^{-8} \lfloor 10^8 y + 1 \rfloor) \geq 1/2$. Given that ε -TeX's integer division obeys $\lfloor b/c \rfloor \leq b/c + 1/2$, we deduce that $10^{4j}z \leq 10^{4j}(\sqrt{a}-y)$, hence $y+z \leq \sqrt{a}$ is an underestimate of \sqrt{a} , as claimed. One implementation detail: because the computation involves $-4*4 - 2*3*5 - 2*2*6$ which may be as low as $-5 \cdot 10^8$, we need to use the `pack_big` functions, and the big shifts.

We receive here the difference $a - y^2 = d = \sum_i d_i \cdot 10^{-4i}$, as $\langle d_2 \rangle \setminus __\text{fp_sep}: \{\langle d_3 \rangle\} \dots \{\langle d_{10} \rangle\}$, where each block has 4 digits, except $\langle d_2 \rangle$. This function finds the largest $j \leq 6$ such that $10^{4j}(a - y^2) < 2 \cdot 10^8$, then leaves an open parenthesis and the integer $\lfloor 10^{4j}(a - y^2) \rfloor$ in an integer expression. The closing parenthesis is provided by the caller $\setminus __\text{fp_sqrt_auxii_o:NnnnnnnnN}$, which completes the expression

$$10^{4j}z = \left[(\lfloor 10^{4j}(a - y^2) \rfloor - 257) \cdot (0.5 \cdot 10^8) \right] / \lfloor 10^8 y + 1 \rfloor$$

for an estimate of $10^{4j}(\sqrt{a} - y)$. If $d_2 \geq 2$, $j = 3$ and the `auxiv` auxiliary receives $10^{12}z$. If $d_2 \leq 1$ but $10^4 d_2 + d_3 \geq 2$, $j = 4$ and the `auxv` auxiliary is called, and receives $10^{16}z$, and so on. In all those cases, the `auxviii` auxiliary is set up to add z to y , then go back to the `auxii` step with continuation `auxiii` (the function we are currently describing). The maximum value of j is 6, regardless of whether $10^{12}d_2 + 10^8d_3 + 10^4d_4 + d_5 \geq 1$. In this last case, we detect when $10^{24}z < 10^7$, which essentially means $\sqrt{a} - y \lesssim 10^{-17}$: once this threshold is reached, there is enough information to find the correctly rounded \sqrt{a} with only one more call to $\setminus __\text{fp_sqrt_auxii_o:NnnnnnnnN}$. Note that the iteration cannot be stuck before reaching $j = 6$, because for $j < 6$, one has $2 \cdot 10^8 \leq 10^{4(j+1)}(a - y^2)$, hence

$$10^{4j}z \geq \frac{(20000 - 257)(0.5 \cdot 10^8)}{\lfloor 10^8 y + 1 \rfloor} \geq (20000 - 257) \cdot 0.5 > 0.$$

(End of definition for _fp_sqrt_auxviii_o:nnnnnnnn and _fp_sqrt_auxix_o:wnwnw.)

_fp_sqrt_auxx_o:Nnnnnnnnn At this stage, $j = 6$ and $10^{24}z < 10^7$, hence
_fp_sqrt_auxxi_o:wnnnN

$$10^7 + 1/2 > 10^{24}z + 1/2 \geq (10^{24}(a - y^2) - 258) \cdot (0.5 \cdot 10^8) / (10^8y + 1),$$

then $10^{24}(a - y^2) - 258 < 2(10^7 + 1/2)(y + 10^{-8})$, and

$$10^{24}(a - y^2) < (10^7 + 1290.5)(1 + 10^{-8}/y)(2y) < (10^7 + 1290.5)(1 + 10^{-7})(y + \sqrt{a}),$$

which finally implies $0 \leq \sqrt{a} - y < 0.2 \cdot 10^{-16}$. In particular, y is an underestimate of \sqrt{a} and $y + 0.5 \cdot 10^{-16}$ is a (strict) overestimate. There is at exactly one multiple m of $0.5 \cdot 10^{-16}$ in the interval $[y, y + 0.5 \cdot 10^{-16})$. If $m^2 > a$, then the square root is inexact and is obtained by rounding $m - \epsilon$ to a multiple of 10^{-16} (the precise shift $0 < \epsilon < 0.5 \cdot 10^{-16}$ is irrelevant for rounding). If $m^2 = a$ then the square root is exactly m , and there is no rounding. If $m^2 < a$ then we round $m + \epsilon$. For now, discard a few irrelevant arguments `#1`, `#2`, `#3`, and find the multiple of $0.5 \cdot 10^{-16}$ within $[y, y + 0.5 \cdot 10^{-16})$; rather, only the last 4 digits `#8` of y are considered, and we do not perform any carry yet. The `auxxi` auxiliary sets up `auxii` with a continuation function `auxxii` instead of `auxiii` as before. To prevent `auxii` from giving a negative results $a - m^2$, we compute $a + 10^{-16} - m^2$ instead, always positive since $m < \sqrt{a} + 0.5 \cdot 10^{-16}$ and $a \leq 1 - 10^{-16}$.

The difference $0 \leq a + 10^{-16} - m^2 \leq 10^{-16} + (\sqrt{a} - m)(\sqrt{a} + m) \leq 2 \cdot 10^{-16}$ was just computed: its first 8 digits vanish, as do the next four, #1, and most of the following four, #2. The guess m is an overestimate if $a + 10^{-16} - m^2 < 10^{-16}$, that is, #1#2 vanishes. Otherwise it is an underestimate, unless $a + 10^{-16} - m^2 = 10^{-16}$ exactly. For an underestimate, call the auxxiv function with argument 9998. For an exact result call it with 9999, and for an overestimate call it with 10000.

__fp_sqrt_auxxiv_o:wnnnnnnnnN

This receives 9998, 9999 or 10000 as #1 when m is an underestimate, exact, or an overestimate, respectively. Then comes m as five blocks of 4 digits, but where the last block #6 may be 0, 5000, or 10000. In the latter case, we need to add a carry, unless m is an overestimate (#1 is then 10000). Then comes a as three arguments. Rounding is done by __fp_round:NNN, whose first argument is the final sign 0 (square roots are positive). We fake its second argument. It should be the last digit kept, but this is only used when ties are “rounded to even”, and only when the result is exactly half-way between two representable numbers rational square roots of numbers with 16 significant digits have: this situation never arises for the square root, as any exact square root of a 16 digit number has at most 8 significant digits. Finally, the last argument is the next digit, possibly shifted by 1 when there are further nonzero digits. This is achieved by __fp_round_digit:Nw, which receives (after removal of the 10000’s digit) one of 0000, 0001, 4999, 5000, 5001, or 9999, which it converts to 0, 1, 4, 5, 6, and 9, respectively.

Chapter 78

l3fp-extended implementation

27094 $\langle *code \rangle$

27095 $\langle @@=fp \rangle$

78.1 Description of fixed point numbers

This module provides a few functions to manipulate positive floating point numbers with extended precision (24 digits), but mostly provides functions for fixed-point numbers with this precision (24 digits). Those are used in the computation of Taylor series for the logarithm, exponential, and trigonometric functions. Since we eventually only care about the 16 first digits of the final result, some of the calculations are not performed with the full 24-digit precision. In other words, the last two blocks of each fixed point number may be wrong as long as the error is small enough to be rounded away when converting back to a floating point number. The fixed point numbers are expressed as

$$\{\langle a_1 \rangle\} \{\langle a_2 \rangle\} \{\langle a_3 \rangle\} \{\langle a_4 \rangle\} \{\langle a_5 \rangle\} \{\langle a_6 \rangle\} \backslash_fp_sep:$$

where each $\langle a_i \rangle$ is exactly 4 digits (ranging from 0000 to 9999), except $\langle a_1 \rangle$, which may be any “not-too-large” non-negative integer, with or without leading zeros. Here, “not-too-large” depends on the specific function (see the corresponding comments for details). Checking for overflow is the responsibility of the code calling those functions. The fixed point number a corresponding to the representation above is $a = \sum_{i=1}^6 \langle a_i \rangle \cdot 10^{-4i}$.

Most functions we define here have the form

$\backslash_fp_fixed_ \langle calculation \rangle : wwn \langle operand_1 \rangle \backslash_fp_sep:$
 $\langle operand_2 \rangle \backslash_fp_sep: \{\langle continuation \rangle\}$

They perform the $\langle calculation \rangle$ on the two $\langle operands \rangle$, then feed the result (6 brace groups followed by a $\backslash_fp_sep:$) to the $\langle continuation \rangle$, responsible for the next step of the calculation. Some functions only accept an N-type $\langle continuation \rangle$. This allows constructions such as

$\backslash_fp_fixed_add: wwn \langle X_1 \rangle \backslash_fp_sep: \langle X_2 \rangle \backslash_fp_sep:$
 $\backslash_fp_fixed_mul: wwn \langle X_3 \rangle \backslash_fp_sep:$
 $\backslash_fp_fixed_add: wwn \langle X_4 \rangle \backslash_fp_sep:$

to compute $(X_1 + X_2) \cdot X_3 + X_4$. This turns out to be very appropriate for computing continued fractions and Taylor series.

At the end of the calculation, the result is turned back to a floating point number using `__fp_fixed_to_float_o:wN`. This function has to change the exponent of the floating point number: it must be used after starting an integer expression for the overall exponent of the result.

78.2 Helpers for numbers with extended precision

`\c__fp_one_fixed_tl` The fixed-point number 1, used in `l3fp-expo`.

```
27096 \tl_const:Nn \c__fp_one_fixed_tl
27097 { {10000} {0000} {0000} {0000} {0000} {0000} \__fp_sep: }
```

(End of definition for `\c__fp_one_fixed_tl`.)

`__fp_fixed_continue:wn` This function simply calls the next function.

```
27098 \cs_new:Npn \__fp_fixed_continue:wn #1\__fp_sep: #2 { #2 #1\__fp_sep: }
```

(End of definition for `__fp_fixed_continue:wn`.)

`__fp_fixed_add_one:wN` `__fp_fixed_add_one:wN` $\langle a \rangle$ `__fp_sep:` $\langle continuation \rangle$

This function adds 1 to the fixed point $\langle a \rangle$, by changing a_1 to $10000 + a_1$, then calls the $\langle continuation \rangle$. This requires $a_1 + 10000 < 2^{31}$.

```
27099 \cs_new:Npn \__fp_fixed_add_one:wN #1#2\__fp_sep: #3
27100 {
27101   \exp_after:wN #3 \exp_after:wN
27102   { \int_value:w \__fp_int_eval:w \c__fp_myriad_int + #1 } #2 \__fp_sep:
27103 }
```

(End of definition for `__fp_fixed_add_one:wN`.)

`__fp_fixed_div_myriad:wn` Divide a fixed point number by 10000. This is a little bit more subtle than just removing the last group and adding a leading group of zeros: the first group #1 may have any number of digits, and we must split #1 into the new first group and a second group of exactly 4 digits. The choice of shifts allows #1 to be in the range $[0, 5 \cdot 10^8 - 1]$.

```
27104 \cs_new:Npn \__fp_fixed_div_myriad:wn #1#2#3#4#5#6\__fp_sep:
27105 {
27106   \exp_after:wN \__fp_fixed_mul_after:wnn
27107   \int_value:w \__fp_int_eval:w \c__fp_leading_shift_int
27108   \exp_after:wN \__fp_pack:NNNNNw
27109   \int_value:w \__fp_int_eval:w \c__fp_trailing_shift_int
27110   + #1 \__fp_sep: {#2}{#3}{#4}{#5}\__fp_sep:
27111 }
```

(End of definition for `__fp_fixed_div_myriad:wn`.)

`__fp_fixed_mul_after:wnn` The fixed point operations which involve multiplication end by calling this auxiliary. It braces the last block of digits, and places the $\langle continuation \rangle$ #3 in front.

```
27112 \cs_new:Npn \__fp_fixed_mul_after:wnn #1\__fp_sep: #2\__fp_sep: #3
27113 { #3 {#1} #2\__fp_sep: }
```

(End of definition for `__fp_fixed_mul_after:wnn`.)

78.3 Multiplying a fixed point number by a short one

`_fp_fixed_mul_short:wnn`

```
\_fp_fixed_mul_short:wnn
  {⟨a1⟩} {⟨a2⟩} {⟨a3⟩} {⟨a4⟩} {⟨a5⟩} {⟨a6⟩} \_fp_sep:
  {⟨b0⟩} {⟨b1⟩} {⟨b2⟩} \_fp_sep: {⟨continuation⟩}
```

Computes the product $c = ab$ of $a = \sum_i \langle a_i \rangle 10^{-4i}$ and $b = \sum_i \langle b_i \rangle 10^{-4i}$, rounds it to the closest multiple of 10^{-24} , and leaves $\langle continuation \rangle \{ \langle c_1 \rangle \} \dots \{ \langle c_6 \rangle \} _fp_sep:$ in the input stream, where each of the $\langle c_i \rangle$ are blocks of 4 digits, except $\langle c_1 \rangle$, which is any TeX integer. Note that indices for $\langle b \rangle$ start at 0: for instance a second operand of $\{0001\}\{0000\}\{0000\}$ leaves the first operand unchanged (rather than dividing it by 10^4 , as `_fp_fixed_mul:wnn` would).

78.4 Dividing a fixed point number by a small integer

`_fp_fixed_div_int:wnN`

`_fp_fixed_div_int:wnN`

`_fp_fixed_div_int_auxi:wnn`

`_fp_fixed_div_int_auxii:wnn`

`_fp_fixed_div_int_pack:Nw`

`_fp_fixed_div_int_after:Nw`

```
\_fp_fixed_div_int:wnN ⟨a⟩ \_fp_sep: ⟨n⟩ \_fp_sep: ⟨continuation⟩
```

Divides the fixed point number $\langle a \rangle$ by the (small) integer $0 < \langle n \rangle < 10^4$ and feeds the result to the $\langle continuation \rangle$. There is no bound on a_1 .

The arguments of the `i` auxiliary are 1: one of the a_i , 2: n , 3: the `ii` or the `iii` auxiliary. It computes a (somewhat tight) lower bound Q_i for the ratio a_i/n .

The `ii` auxiliary receives Q_i , n , and a_i as arguments. It adds Q_i to a surrounding integer expression, and starts a new one with the initial value 9999, which ensures that the result of this expression has 5 digits. The auxiliary also computes $a_i - n \cdot Q_i$, placing the result in front of the 4 digits of a_{i+1} . The resulting $a'_{i+1} = 10^4(a_i - n \cdot Q_i) + a_{i+1}$ serves as the first argument for a new call to the `i` auxiliary.

When the `iii` auxiliary is called, the situation looks like this:

```

\__fp_fixed_div_int_after:Nw <continuation>
-1 + Q1
\__fp_fixed_div_int_pack:Nw 9999 + Q2
\__fp_fixed_div_int_pack:Nw 9999 + Q3
\__fp_fixed_div_int_pack:Nw 9999 + Q4
\__fp_fixed_div_int_pack:Nw 9999 + Q5
\__fp_fixed_div_int_pack:Nw 9999
\__fp_fixed_div_int_auxii:wnn Q6 \__fp_sep: {<n>} {<a6>}

```

where expansion is happening from the last line up. The iii auxiliary adds $Q_6 + 2 \simeq a_6/n + 1$ to the last 9999, giving the integer closest to $10000 + a_6/n$.

Each **pack** auxiliary receives 5 digits followed by a **__fp_sep:**. The first digit is added as a carry to the integer expression above, and the 4 other digits are braced. Each call to the **pack** auxiliary thus produces one brace group. The last brace group is produced by the **after** auxiliary, which places the **<continuation>** as appropriate.

```

\__fp_fixed_add_pack:NNNNNwn
\__fp_fixed_add_after:NNNNNwn

```

Computes $a+b$ (resp. $a-b$) and feeds the result to the $\langle continuation \rangle$. This function requires $0 \leq a_1, b_1 \leq 114748$, its result must be positive (this happens automatically for addition) and its first group must have at most 5 digits: $(a \pm b)_1 < 100000$. The two functions only differ by a sign, hence use a common auxiliary. It would be nice to grab the 12 brace groups in one go; only 9 parameters are allowed. Start by grabbing the sign, a_1, \dots, a_4 , the rest of a , and b_1 and b_2 . The second auxiliary receives the rest of a , the sign multiplying b , the rest of b , and the $\langle continuation \rangle$ as arguments. After going down through the various level, we go back up, packing digits and bringing the $\langle continuation \rangle$ (#8, then #7) from the end of the argument list to its start.

78.6 Multiplying fixed points

$__fp_fixed_mul:wnn$
 $__fp_fixed_mul:nnnnnnnw$

$__fp_fixed_mul:wnn \langle a \rangle __fp_sep: \langle b \rangle __fp_sep: \{\langle continuation \rangle\}$

Computes $a \times b$ and feeds the result to $\langle continuation \rangle$. This function requires $0 \leq a_1, b_1 < 10000$. Once more, we need to play around the limit of 9 arguments for \TeX macros. Note that we don't need to obtain an exact rounding, contrarily to the $*$ operator, so things could be harder. We wish to perform carries in

$$\begin{aligned}
a \times b = & a_1 \cdot b_1 \cdot 10^{-8} \\
& + (a_1 \cdot b_2 + a_2 \cdot b_1) \cdot 10^{-12} \\
& + (a_1 \cdot b_3 + a_2 \cdot b_2 + a_3 \cdot b_1) \cdot 10^{-16} \\
& + (a_1 \cdot b_4 + a_2 \cdot b_3 + a_3 \cdot b_2 + a_4 \cdot b_1) \cdot 10^{-20} \\
& + \left(a_2 \cdot b_4 + a_3 \cdot b_3 + a_4 \cdot b_2 \right. \\
& \quad \left. + \frac{a_3 \cdot b_4 + a_4 \cdot b_3 + a_1 \cdot b_6 + a_2 \cdot b_5 + a_5 \cdot b_2 + a_6 \cdot b_1}{10^4} \right. \\
& \quad \left. + a_1 \cdot b_5 + a_5 \cdot b_1 \right) \cdot 10^{-24} + O(10^{-24}),
\end{aligned}$$

where the $O(10^{-24})$ stands for terms which are at most $5 \cdot 10^{-24}$; ignoring those leads to an error of at most 5 ulp. Note how the first 15 terms only depend on a_1, \dots, a_4 and b_1, \dots, b_4 , while the last 6 terms only depend on a_1, a_2, a_5, a_6 , and the corresponding parts of b . Hence, the first function grabs a_1, \dots, a_4 , the rest of a , and b_1, \dots, b_4 , and writes the 15 first terms of the expression, including a left parenthesis for the fraction. The `i` auxiliary receives $a_5, a_6, b_1, b_2, a_1, a_2, b_5, b_6$ and finally the $\langle continuation \rangle$ as arguments. It writes the end of the expression, including the right parenthesis and the denominator of the fraction. The $\langle continuation \rangle$ is finally placed in front of the 6 brace groups by `_fp_fixed_mul_after:wwn`.

78.7 Combining product and sum of fixed points

```

\_fp\_fixed\_mul\_add:wwwn <a> \_fp\_sep: <b> \_fp\_sep: <c> \_fp\_sep:
{<continuation>}
\_fp\_fixed\_mul\_sub\_back:wwwn <a> \_fp\_sep: <b> \_fp\_sep: <c> \_fp\_sep:
{<continuation>}
\_fp\_fixed\_mul\_one\_minus\_mul:wwn <a> \_fp\_sep: <b> \_fp\_sep: {<continuation>}

```

Sometimes called FMA (fused multiply-add), these functions compute $a \times b + c$, $c - a \times b$, and $1 - a \times b$ and feed the result to the $\langle continuation \rangle$. Those functions require $0 \leq a_1, b_1, c_1 \leq 10000$. Since those functions are at the heart of the computation of Taylor expansions, we over-optimize them a bit, and in particular we do not factor out the common parts of the three functions.

For definiteness, consider the task of computing $a \times b + c$. We perform carries in

$$\begin{aligned}
a \times b + c = & (a_1 \cdot b_1 + c_1 c_2) \cdot 10^{-8} \\
& + (a_1 \cdot b_2 + a_2 \cdot b_1) \cdot 10^{-12} \\
& + (a_1 \cdot b_3 + a_2 \cdot b_2 + a_3 \cdot b_1 + c_3 c_4) \cdot 10^{-16} \\
& + (a_1 \cdot b_4 + a_2 \cdot b_3 + a_3 \cdot b_2 + a_4 \cdot b_1) \cdot 10^{-20} \\
& + \left(a_2 \cdot b_4 + a_3 \cdot b_3 + a_4 \cdot b_2 \right. \\
& \quad \left. + \frac{a_3 \cdot b_4 + a_4 \cdot b_3 + a_1 \cdot b_6 + a_2 \cdot b_5 + a_5 \cdot b_2 + a_6 \cdot b_1}{10^4} \right. \\
& \quad \left. + a_1 \cdot b_5 + a_5 \cdot b_1 + c_5 c_6 \right) \cdot 10^{-24} + O(10^{-24}),
\end{aligned}$$

where $c_1 c_2, c_3 c_4, c_5 c_6$ denote the 8-digit number obtained by juxtaposing the two blocks of digits of c , and \cdot denotes multiplication. The task is obviously tough because we have 18 brace groups in front of us.

Each of the three function starts the first two levels (the first, corresponding to 10^{-4} , is empty), with $c_1 c_2$ in the first level, calls the `i` auxiliary with arguments described later, and adds a trailing `+ c_5 c_6 ___fp_sep: {\langle continuation \rangle} ___fp_sep:`. The `+ c_5 c_6` piece, which is omitted for `___fp_fixed_one_minus_mul:wwn`, is taken in the integer expression for the 10^{-24} level.

`_fp_fixed_mul_add:nnnnwnnnn` $\langle a \rangle _fp_sep: \langle b \rangle _fp_sep: \langle op \rangle$
 $+ \langle c_5 \rangle \langle c_6 \rangle _fp_sep:$

Level 10^{-20} is $(a_1 \cdot b_4 + a_2 \cdot b_3 + a_3 \cdot b_2 + a_4 \cdot b_1)$, multiplied by the sign, which was inserted by the *i* auxiliary. Then we prepare level 10^{-24} . We don't have access to all parts of $\langle a \rangle$ and $\langle b \rangle$ needed to make all products. Instead, we prepare the partial expressions

$$b_1 + a_4 \cdot b_2 + a_3 \cdot b_3 + a_2 \cdot b_4 + a_1$$

$$b_2 + a_4 \cdot b_3 + a_3 \cdot b_4 + a_2.$$

Obviously, those expressions make no mathematical sense: we complete them with $a_5 \cdot$ and $\cdot b_5$, and with $a_6 \cdot b_1 + a_5 \cdot$ and $\cdot b_5 + a_1 \cdot b_6$, and of course with the trailing $+ c_5 c_6$. To do all this, we keep a_1 , a_5 , a_6 , and the corresponding pieces of $\langle b \rangle$.

```

Complete the $\langle partial_1 \rangle$ and $\langle partial_2 \rangle$ expressions as explained for the `ii` auxiliary. The second one is divided by 10000: this is the carry from level 10^{-28} . The trailing $+ c_5 c_6$ is taken into the expression for level 10^{-24} . Note that the total of level 10^{-24} is in the interval $[-5 \cdot 10^8, 6 \cdot 10^8]$ (give or take a couple of 10000), hence adding it to the shift gives a 10-digit number, as expected by the packing auxiliaries. See `l3fp-aux` for the definition of the shifts and packing auxiliaries.

78.8 Extended-precision floating point numbers

In this section we manipulate floating point numbers with roughly 24 significant figures (“extended-precision” numbers, in short, “ep”), which take the form of an integer exponent, followed by a comma, then six groups of digits, ending with a `_fp_sep:`. The first group of digit may be any non-negative integer, while other groups of digits have 4 digits. In other words, an extended-precision number is an exponent ending in a comma, then a fixed point number. The corresponding value is $0.\langle digits \rangle \cdot 10^{\langle exponent \rangle}$. This convention differs from floating points.

`_fp_ep_to_fixed:wwn` Converts an extended-precision number with an exponent at most 4 and a first block less than 10^8 to a fixed point number whose first block has 12 digits, hopefully starting with many zeros.

`__fp_ep_to_ep:wwN`
`__fp_ep_to_ep_loop:N`
`__fp_ep_to_ep_end:www`
`__fp_ep_to_ep_zero:ww`

Normalize an extended-precision number. More precisely, leading zeros are removed from the mantissa of the argument, decreasing its exponent as appropriate. Then the digits are packed into 6 groups of 4 (discarding any remaining digit, not rounding). Finally, the continuation `#8` is placed before the resulting exponent-mantissa pair. The input exponent may in fact be given as an integer expression. The `loop` auxiliary grabs a digit: if it is 0, decrement the exponent and continue looping, and otherwise call the `end` auxiliary, which places all digits in the right order (the digit that was not 0, and any remaining digits), followed by some 0, then packs them up neatly in $3 \times 2 = 6$ blocks of four. At the end of the day, remove with `__fp_use_i:ww` any digit that did not make it in the final mantissa (typically only zeros, unless the original first block has more than 4 digits).

78.9 Dividing extended-precision numbers

Divisions of extended-precision numbers are difficult to perform with exact rounding: the technique used in l3fp-basics for 16-digit floating point numbers does not generalize easily to 24-digit numbers. Thankfully, there is no need for exact rounding.

Let us call $\langle n \rangle$ the numerator and $\langle d \rangle$ the denominator. After a simple normalization step, we can assume that $\langle n \rangle \in [0.1, 1)$ and $\langle d \rangle \in [0.1, 1)$, and compute $\langle n \rangle / (10 \langle d \rangle) \in (0.01, 1)$. In terms of the 6 blocks of digits $\langle n_1 \rangle \cdots \langle n_6 \rangle$ and the 6 blocks $\langle d_1 \rangle \cdots \langle d_6 \rangle$, the condition translates to $\langle n_1 \rangle, \langle d_1 \rangle \in [1000, 9999]$.

We first find an integer estimate $a \simeq 10^8/\langle d \rangle$ by computing

$$\begin{aligned}\alpha &= \left\lfloor \frac{10^9}{\langle d_1 \rangle + 1} \right\rfloor \\ \beta &= \left\lfloor \frac{10^9}{\langle d_1 \rangle} \right\rfloor \\ a &= 10^3\alpha + (\beta - \alpha) \cdot \left(10^3 - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \right) - 1250,\end{aligned}$$

where $\left\lfloor \frac{\cdot}{\cdot} \right\rfloor$ denotes ε -TeX's rounding division, which rounds ties away from zero. The idea is to interpolate between $10^3\alpha$ and $10^3\beta$ with a parameter $\langle d_2 \rangle/10^4$, so that when $\langle d_2 \rangle = 0$ one gets $a = 10^3\beta - 1250 \simeq 10^{12}/\langle d_1 \rangle \simeq 10^8/\langle d \rangle$, while when $\langle d_2 \rangle = 9999$ one gets $a = 10^3\alpha - 1250 \simeq 10^{12}/(\langle d_1 \rangle + 1) \simeq 10^8/\langle d \rangle$. The shift by 1250 helps to ensure that a is an underestimate of the correct value. We shall prove that

$$1 - 1.755 \cdot 10^{-5} < \frac{\langle d \rangle a}{10^8} < 1.$$

We can then compute the inverse of $\langle d \rangle a/10^8 = 1 - \epsilon$ using the relation $1/(1 - \epsilon) \simeq (1 + \epsilon)(1 + \epsilon^2) + \epsilon^4$, which is correct up to a relative error of $\epsilon^5 < 1.6 \cdot 10^{-24}$. This allows us to find the desired ratio as

$$\frac{\langle n \rangle}{\langle d \rangle} = \frac{\langle n \rangle a}{10^8} ((1 + \epsilon)(1 + \epsilon^2) + \epsilon^4).$$

Let us prove the upper bound first (multiplied by 10^{15}). Note that $10^7\langle d \rangle < 10^3\langle d_1 \rangle + 10^{-1}(\langle d_2 \rangle + 1)$, and that ε -TeX's division $\left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor$ underestimates $10^{-1}(\langle d_2 \rangle + 1)$ by 0.5 at most, as can be checked for each possible last digit of $\langle d_2 \rangle$. Then,

$$10^7\langle d \rangle a < \left(10^3\langle d_1 \rangle + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor + \frac{1}{2} \right) \left(\left(10^3 - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \right) \beta + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \alpha - 1250 \right) \quad (1)$$

$$< \left(10^3\langle d_1 \rangle + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor + \frac{1}{2} \right) \quad (2)$$

$$\left(\left(10^3 - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \right) \left(\frac{10^9}{\langle d_1 \rangle} + \frac{1}{2} \right) + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \left(\frac{10^9}{\langle d_1 \rangle + 1} + \frac{1}{2} \right) - 1250 \right) \quad (3)$$

$$< \left(10^3\langle d_1 \rangle + \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor + \frac{1}{2} \right) \left(\frac{10^{12}}{\langle d_1 \rangle} - \left\lfloor \frac{\langle d_2 \rangle}{10} \right\rfloor \frac{10^9}{\langle d_1 \rangle(\langle d_1 \rangle + 1)} - 750 \right) \quad (4)$$

We recognize a quadratic polynomial in $[\langle d_2 \rangle/10]$ with a negative leading coefficient: this polynomial is bounded above, according to $([\langle d_2 \rangle/10] + a)(b - c[\langle d_2 \rangle/10]) \leq (b + ca)^2/(4c)$. Hence,

$$10^7\langle d \rangle a < \frac{10^{15}}{\langle d_1 \rangle(\langle d_1 \rangle + 1)} \left(\langle d_1 \rangle + \frac{1}{2} + \frac{1}{4}10^{-3} - \frac{3}{8} \cdot 10^{-9}\langle d_1 \rangle(\langle d_1 \rangle + 1) \right)^2$$

Since $\langle d_1 \rangle$ takes integer values within $[1000, 9999]$, it is a simple programming exercise to check that the squared expression is always less than $\langle d_1 \rangle(\langle d_1 \rangle + 1)$, hence $10^7\langle d \rangle a < 10^{15}$. The upper bound is proven. We also find that $\frac{3}{8}$ can be replaced by slightly smaller numbers, but nothing less than $0.374563\dots$, and going back through the derivation of

the upper bound, we find that 1250 is as small a shift as we can obtain without breaking the bound.

Now, the lower bound. The same computation as for the upper bound implies

$$10^7 \langle d \rangle a > \left(10^3 \langle d_1 \rangle + \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil - \frac{1}{2} \right) \left(\frac{10^{12}}{\langle d_1 \rangle} - \left\lceil \frac{\langle d_2 \rangle}{10} \right\rceil \frac{10^9}{\langle d_1 \rangle (\langle d_1 \rangle + 1)} - 1750 \right)$$

This time, we want to find the minimum of this quadratic polynomial. Since the leading coefficient is still negative, the minimum is reached for one of the extreme values $[y/10] = 0$ or $[y/10] = 100$, and we easily check the bound for those values.

We have proven that the algorithm gives us a precise enough answer. Incidentally, the upper bound that we derived tells us that $a < 10^8 / \langle d \rangle \leq 10^9$, hence we can compute a safely as a $\text{T}_{\text{E}}\text{X}$ integer, and even add 10^9 to it to ease grabbing of all the digits. The lower bound implies $10^8 - 1755 < a$, which we do not care about.

`__fp_ep_div:wwwn` Compute the ratio of two extended-precision numbers. The result is an extended-precision number whose first block lies in the range $[100, 9999]$, and is placed after the $\langle \text{continuation} \rangle$ once we are done. First normalize the inputs so that both first block lie in $[1000, 9999]$, then call `__fp_ep_div_esti:wwwn` $\langle \text{denominator} \rangle$ $\langle \text{numerator} \rangle$, responsible for estimating the inverse of the denominator.

(End of definition for `__fp_ep_div:wwwn`.)

`__fp_ep_div_esti:wwwn` The `esti` function evaluates $\alpha = 10^9 / (\langle d_1 \rangle + 1)$, which is used twice in the expression for a , and combines the exponents `#1` and `#4` (with a shift by 1 because we later compute $\langle n \rangle / (10 \langle d \rangle)$). Then the `estii` function evaluates $10^9 + a$, and puts the exponent `#2` after the continuation `#7`: from there on we can forget exponents and focus on the mantissa. The `estiii` function multiplies the denominator `#7` by $10^{-8}a$ (obtained as a split into the single digit `#1` and two blocks of 4 digits, `#2#3#4#5` and `#6`). The result $10^{-8}a \langle d \rangle = (1 - \epsilon)$, and a partially packed $10^{-9}a$ (as a block of four digits, and five individual digits, not packed by lack of available macro parameters here) are passed to `__fp_ep_div_epsilon:wnNNNNn`, which computes $10^{-9}a / (1 - \epsilon)$, that is, $1 / (10 \langle d \rangle)$ and we finally multiply this by the numerator `#8`.

__fp_ep_div_epsilon:wnNNNNNn
 __fp_ep_div_eps_pack:NNNNNw
 __fp_ep_div_epsii:wnNNNNNn

The bounds shown above imply that the `epsi` function's first operand is $(1 - \epsilon)$ with $\epsilon \in [0, 1.755 \cdot 10^{-5}]$. The `epsi` function computes ϵ as $1 - (1 - \epsilon)$. Since $\epsilon < 10^{-4}$, its first block vanishes and there is no need to explicitly use `#1` (which is 9999). Then `epsii` evaluates $10^{-9}a/(1 - \epsilon)$ as $(1 + \epsilon^2)(1 + \epsilon)(10^{-9}a\epsilon) + 10^{-9}a$. Importantly, we compute $10^{-9}a\epsilon$ before multiplying it with the rest, rather than multiplying by ϵ and then $10^{-9}a$, as this second option loses more precision. Also, the combination of `short_mul` and `div_myriad` is both faster and more precise than a simple `mul`.

78.10 Inverse square root of extended precision numbers

The idea here is similar to division. Normalize the input, multiplying by powers of 100 until we have $x \in [0.01, 1)$. Then find an integer approximation $r \in [101, 1003]$ of $10^2/\sqrt{x}$, as the fixed point of iterations of the Newton method: essentially $r \mapsto (r + 10^8/(x_1 r))/2$, starting from a guess that optimizes the number of steps before convergence. In fact, just as there is a slight shift when computing divisions to ensure that some inequalities hold, we replace 10^8 by a slightly larger number which ensures that $r^2 x \geq 10^4$. This also causes $r \in [101, 1003]$. Another correction to the above is that the input is actually normalized to $[0.1, 1)$, and we use either 10^8 or 10^9 in the Newton method, depending on the parity of the exponent. Skipping those technical hurdles, once we have the approximation r , we set $y = 10^{-4} r^2 x$ (or rather, the correct power of 10 to get $y \simeq 1$) and compute $y^{-1/2}$ through another application of Newton's method. This time, the starting value is $z = 1$, each step maps $z \mapsto z(1.5 - 0.5yz^2)$, and we perform a fixed number of steps. Our final result combines r with $y^{-1/2}$ as $x^{-1/2} = 10^{-2} r y^{-1/2}$.

```

    \_fp_ep_isqrt:wwn
    \_fp_ep_isqrt_aux:wwn
    \_fp_ep_isqrt_auxii:wwnnwn

```

First normalize the input, then check the parity of the exponent #1. If it is even, the result's exponent will be $-\#1/2$, otherwise it will be $(\#1 - 1)/2$ (except in the case where the input was an exact power of 100). The `auxii` function receives as #1 the result's exponent just computed, as #2 the starting value for the iteration giving r (the values 168 and 535 lead to the least number of iterations before convergence, on average), as #3 and #4 one empty argument and one 0, depending on the parity of the original exponent, as #5 and #6 the normalized mantissa ($\#5 \in [1000, 9999]$), and as #7 the continuation. It sets up the iteration giving r : the `esti` function thus receives the initial two guesses #2 and 0, an approximation #5 of $10^4 x$ (its first block of digits), and the empty/zero arguments #3 and #4, followed by the mantissa and an altered continuation where we have stored the result's exponent.

```

(End of definition for `_fp_ep_isqrt:wwn`, `_fp_ep_isqrt_aux:wwn`, and `_fp_ep_isqrt_auxii:wwnnwn`.)

```

    \_fp_ep_isqrt_esti:wwnnwn
    \_fp_ep_isqrt_estii:wwnnwn
    \_fp_ep_isqrt_estiii:NNNNwwn

```

If the last two approximations gave the same result, we are done: call the `estii` function to clean up. Otherwise, evaluate $(\langle \text{prev} \rangle + 1.005 \cdot 10^8 \text{ or } 9 / (\langle \text{prev} \rangle \cdot x))/2$, as the next approximation: omitting the 1.005 factor, this would be Newton's method. We can check

by brute force that if #4 is empty (the original exponent was even), the process computes an integer slightly larger than $100/\sqrt{x}$, while if #4 is 0 (the original exponent was odd), the result is an integer slightly larger than $100/\sqrt{x/10}$. Once we are done, we evaluate $100r^2/2$ or $10r^2/2$ (when the exponent is even or odd, respectively) and feed that to **esti**. This third auxiliary finds $y_{\text{even}}/2 = 10^{-4}r^2x/2$ or $y_{\text{odd}}/2 = 10^{-5}r^2x/2$ (again, depending on earlier parity). A simple program shows that $y \in [1, 1.0201]$. The number $y/2$ is fed to **__fp_ep_isqrt_epsilon:wN**, which computes $1/\sqrt{y}$, and we finally multiply the result by r .

78.11 Converting from fixed point to floating point

After computing Taylor series, we wish to convert the result from extended precision (with or without an exponent) to the public floating point format. The functions here should be called within an integer expression for the overall exponent of the floating point.

`__fp_ep_to_float_o:wwN`
`__fp_ep_inv_to_float_o:wwN`

An extended-precision number is simply a comma-delimited exponent followed by a fixed point number. Leave the exponent in the current integer expression then convert the fixed point number.

```
27472 \cs_new:Npn \__fp_ep_to_float_o:wwN #1,
27473 { + \__fp_int_eval:w #1 \__fp_fixed_to_float_o:wN }
27474 \cs_new:Npn \__fp_ep_inv_to_float_o:wwN #1,#2\__fp_sep:
27475 {
27476   \__fp_ep_div:wwwwn
27477   1,{1000}{0000}{0000}{0000}{0000}{0000}\__fp_sep: #1,#2\__fp_sep:
27478   \__fp_ep_to_float_o:wwN
27479 }
```

(End of definition for `__fp_ep_to_float_o:wwN` and `__fp_ep_inv_to_float_o:wwN`.)

`__fp_fixed_inv_to_float_o:wN`

Another function which reduces to converting an extended precision number to a float.

```
27480 \cs_new:Npn \__fp_fixed_inv_to_float_o:wN
27481 { \__fp_ep_inv_to_float_o:wwN 0, }
```

(End of definition for `__fp_fixed_inv_to_float_o:wN`.)

`__fp_fixed_to_float_rad_o:wN`

Converts the fixed point number `#1` from degrees to radians then to a floating point number. This could perhaps remain in `l3fp-trig`.

```
27482 \cs_new:Npn \__fp_fixed_to_float_rad_o:wN #1\__fp_sep:
27483 {
27484   \__fp_fixed_mul:wwn #1\__fp_sep: {5729}{5779}{5130}{8232}{0876}{7981}\__fp_sep:
27485   { \__fp_ep_to_float_o:wwN 2, }
27486 }
```

(End of definition for `__fp_fixed_to_float_rad_o:wN`.)

`__fp_fixed_to_float_o:wN`
`__fp_fixed_to_float_o:Nw`

... `__fp_int_eval:w` $\langle exponent \rangle$ `__fp_fixed_to_float_o:wN` $\{\langle a_1 \rangle\}$ $\{\langle a_2 \rangle\}$ $\{\langle a_3 \rangle\}$ $\{\langle a_4 \rangle\}$ $\{\langle a_5 \rangle\}$ $\{\langle a_6 \rangle\}$ `__fp_sep:` $\langle sign \rangle$
yields

$\langle exponent' \rangle$ `__fp_sep:` $\{\langle a'_1 \rangle\}$ $\{\langle a'_2 \rangle\}$ $\{\langle a'_3 \rangle\}$ $\{\langle a'_4 \rangle\}$ `__fp_sep:`

And the `to_fixed` version gives six brace groups instead of 4, ensuring that $1000 \leq \langle a'_1 \rangle \leq 9999$. At this stage, we know that $\langle a_1 \rangle$ is positive (otherwise, it is sign of an error before), and we assume that it is less than 10^8 .¹¹

```
27487 \cs_new:Npn \__fp_fixed_to_float_o:Nw #1#2\__fp_sep:
27488 { \__fp_fixed_to_float_o:wN #2\__fp_sep: #1 }

79.1 Logarithm

79.1.1 Work plan

As for many other functions, we filter out special cases in `__fp_ln_o:w`. Then `__fp_ln_npos_o:w` receives a positive normal number, which we write in the form $a \cdot 10^b$ with $a \in [0.1, 1)$.

The rest of this section is actually not in sync with the code. Or is the code not in sync with the section? In the current code, $c \in [1, 10]$ is such that $0.7 \leq ac < 1.4$.

We are given a positive normal number, of the form $a \cdot 10^b$ with $a \in [0.1, 1)$. To compute its logarithm, we find a small integer $5 \leq c < 50$ such that $0.91 \leq ac/5 < 1.1$, and use the relation

$$\ln(a \cdot 10^b) = b \cdot \ln(10) - \ln(c/5) + \ln(ac/5).$$

The logarithms $\ln(10)$ and $\ln(c/5)$ are looked up in a table. The last term is computed using the following Taylor series of \ln near 1:

$$\ln\left(\frac{ac}{5}\right) = \ln\left(\frac{1+t}{1-t}\right) = 2t \left(1 + t^2 \left(\frac{1}{3} + t^2 \left(\frac{1}{5} + t^2 \left(\frac{1}{7} + t^2 \left(\frac{1}{9} + \cdots\right)\right)\right)\right)\right)$$

where $t = 1 - 10/(ac + 5)$. We can now see one reason for the choice of $ac \sim 5$: then $ac + 5 = 10(1 - \epsilon)$ with $-0.05 < \epsilon \leq 0.045$, hence

$$t = \frac{\epsilon}{1 - \epsilon} = \epsilon(1 + \epsilon)(1 + \epsilon^2)(1 + \epsilon^4) \dots,$$

is not too difficult to compute.

79.1.2 Some constants

A few values of the logarithm as extended fixed point numbers. Those are needed in the implementation. It turns out that we don't need the value of $\ln(5)$.

The Taylor series to be used is expressed in terms of $t = (x - 1)/(x + 1) = 1 - 2/(x + 1)$. We now compute the quotient with extended precision, reusing some code from `__fp_-/_o:ww`. Note that $1 + x$ is known exactly.

To reuse notations from `l3fp-basics`, we want to compute A/Z with $A = 2$ and $Z = x + 1$. In `l3fp-basics`, we considered the case where both A and Z are arbitrary, in the range $[0.1, 1)$, and we had to monitor the growth of the sequence of remainders A, B, C , etc. to ensure that no overflow occurred during the computation of the next quotient. The main source of risk was our choice to define the quotient as roughly $10^9 \cdot A/10^5 \cdot Z$: then A was bound to be below $2.147 \dots$, and this limit was never far.

In our case, we can simply work with $10^8 \cdot A$ and $10^4 \cdot Z$, because our reason to work with higher powers has gone: we needed the integer $y \simeq 10^5 \cdot Z$ to be at least 10^4 , and now, the definition $y \simeq 10^4 \cdot Z$ suffices.

Let us thus define $y = \lfloor 10^4 \cdot Z \rfloor + 1 \in (1.7 \cdot 10^4, 2.4 \cdot 10^4]$, and

$$Q_1 = \left\lfloor \frac{\lfloor 10^8 \cdot A \rfloor}{y} - \frac{1}{2} \right\rfloor.$$

(The $1/2$ comes from how ε -TeX rounds.) As for division, it is easy to see that $Q_1 \leq 10^4 A/Z$, i.e., Q_1 is an underestimate.

Exactly as we did for division, we set $B = 10^4 A - Q_1 Z$. Then

$$\begin{aligned}
10^4 B &\leq A_1 A_2 \cdot A_3 A_4 - \left(\frac{A_1 A_2}{y} - \frac{3}{2} \right) 10^4 Z \\
&\leq A_1 A_2 \left(1 - \frac{10^4 Z}{y} \right) + 1 + \frac{3}{2} y \\
&\leq 10^8 \frac{A}{y} + 1 + \frac{3}{2} y
\end{aligned}$$

In the same way, and using $1.7 \cdot 10^4 \leq y \leq 2.4 \cdot 10^4$, and convexity, we get

$$\begin{aligned} 10^4 A &= 2 \cdot 10^4 \\ 10^4 B &\leq 10^8 \frac{A}{y} + 1.6y \leq 4.7 \cdot 10^4 \\ 10^4 C &\leq 10^8 \frac{B}{y} + 1.6y \leq 5.8 \cdot 10^4 \\ 10^4 D &\leq 10^8 \frac{C}{y} + 1.6y \leq 6.3 \cdot 10^4 \\ 10^4 E &\leq 10^8 \frac{D}{y} + 1.6y \leq 6.5 \cdot 10^4 \\ 10^4 F &\leq 10^8 \frac{E}{y} + 1.6y \leq 6.6 \cdot 10^4 \end{aligned}$$

Note that we compute more steps than for division: since t is not the end result, we need to know it with more accuracy (on the other hand, the ending is much simpler, as we don't need an exact rounding for transcendental functions, but just a faithful rounding).

`__fp_ln_x_iv:wnnnnnnnn <1 or 2> <8d> __fp_sep: {<4d>} {<4d>} <fixed-t1>`

The number is x . Compute y by adding 1 to the five first digits.

(End of definition for `__fp_ln_x_ii:wnnnn`.)

`__fp_ln_Taylor:wwNw` Denoting $T = t^2$, we get

```

\__fp_ln_Taylor:wwNw
{<T1>} {<T2>} {<T3>} {<T4>} {<T5>} {<T6>} \__fp_sep: \__fp_sep:
{<(2t)1>} {<(2t)2>} {<(2t)3>} {<(2t)4>} {<(2t)5>} {<(2t)6>} \__fp_sep:
{ \__fp_ln_c:NwNw <sign> }
<fixed t1> <exponent> \__fp_sep: <continuation>

```

And we want to compute

$$\ln\left(\frac{1+t}{1-t}\right) = 2t \left(1 + T\left(\frac{1}{3} + T\left(\frac{1}{5} + T\left(\frac{1}{7} + T\left(\frac{1}{9} + \cdots\right)\right)\right)\right)\right)$$

The process looks as follows (_fp_sep: represented by ;)

```
\loop 5; A;
\div_int 5; 1.0; \add A; \mul T; {\loop \eval 5-2;}
\add 0.2; A; \mul T; {\loop \eval 5-2;}
\mul B; T; {\loop 3;}
\loop 3; C;
```

This uses the routine for dividing a number by a small integer ($< 10^4$).

We are now reduced to finding $\ln(c)$ and $\langle \text{exponent} \rangle \ln(10)$ in a table, and adding it to the mixture. The first step is to get $\ln(c) - \ln(x) = -\ln(a)$, then we get $b \ln(10)$ and add or subtract.

For now, $\ln(x)$ is given as $\cdot 10^0$. Unless both the exponent is 1 and $c = 1$, we shift to working in units of $\cdot 10^4$, since the final result is at least $\ln(10/7) \simeq 0.35$.

Compute $\langle \text{exponent} \rangle$ times $\ln(10)$. Apart from the cases where $\langle \text{exponent} \rangle$ is 0 or 1, the result is necessarily at least $\ln(10) \simeq 2.3$ in magnitude. We can thus drop the least significant 4 digits. In the case of a very large (positive or negative) exponent, we can (and we need to) drop 4 additional digits, since the result is of order 10^4 . Naively, one would think that in both cases we can drop 4 more digits than we do, but that would be slightly too tight for rounding to happen correctly. Besides, we already have addition and subtraction for 24 digits fixed point numbers.

This function is called for numbers in the range $[10^{-9}, 10^{-1})$. We compute 10 terms of the Taylor series. The first argument is irrelevant (rounding digit used by some other functions). The next three arguments, at least 16 digits, delimited by a __fp_sep:, form a fixed point number, so we pack it in blocks of 4 digits.

```

`\c__fp_exp_intarray` The integer array has $6 \times 9 \times 4 = 216$ items encoding the values of $\exp(j \times 10^i)$ for $j = 1, \dots, 9$ and $i = -1, \dots, 4$. Each value is expressed as $\simeq 10^p \times 0.m_1m_2m_3$ with three 8-digit blocks m_1, m_2, m_3 and an integer exponent p (one more than the scientific exponent), and these are stored in the integer array as four items: $p, 10^8 + m_1, 10^8 + m_2, 10^8 + m_3$. The various exponentials are stored in increasing order of $j \times 10^i$.

Storing this data in an integer array makes it slightly harder to access (slower, too), but uses 16 bytes of memory per exponential stored, while storing as tokens used around 40 tokens; tokens have an especially large footprint in Unicode-aware engines.

```

(End of definition for \c__fp_exp_intarray.)

__fp_exp_pos_large:NnnNwn The first two arguments are irrelevant (a rounding digit, and a brace group with 8 zeros).
 __fp_exp_large_after:wnn The third argument is the integer part of our number, then we have the decimal part
 __fp_exp_large:NwN delimited by a __fp_sep:, and finally the exponent, in the range [0, 5]. Remove leading
 __fp_exp_intarray:w zeros from the integer part: putting #4 in there too ensures that an integer part of 0 is also
 __fp_exp_intarray_aux:w removed. Then read digits one by one, looking up $\exp(\langle digit \rangle \cdot 10^{\langle exponent \rangle})$ in a table,
 and multiplying that to the current total. The loop is done by __fp_exp_large:NwN, whose #1 is the $\langle exponent \rangle$, #2 is the current mantissa, and #3 is the $\langle digit \rangle$. At the
 end, __fp_exp_large_after:wnn moves on to the Taylor series, eventually multiplied
 with the mantissa that we have just computed.

79.3 Power

Raising a number a to a power b leads to many distinct situations.

a^b	$-\infty$	$(-\infty, -0)$	$-\text{integer}$	± 0	$+\text{integer}$	$(0, \infty)$	$+\infty$	nan
$+\infty$	$+0$		$+0$	$+1$		$+\infty$	$+\infty$	nan
$(1, \infty)$	$+0$		$+ a ^b$	$+1$		$+ a ^b$	$+\infty$	nan
$+1$	$+1$		$+1$	$+1$		$+1$	$+1$	$+1$
$(0, 1)$	$+\infty$		$+ a ^b$	$+1$		$+ a ^b$	$+0$	nan
$+0$	$+\infty$		$+\infty$	$+1$		$+0$	$+0$	nan
-0	$+\infty$	nan	$(-1)^b \infty$	$+1$	$(-1)^b 0$	$+0$	$+0$	nan
$(-1, 0)$	$+\infty$	nan	$(-1)^b a ^b$	$+1$	$(-1)^b a ^b$	nan	$+0$	nan
-1	$+1$	nan	$(-1)^b$	$+1$	$(-1)^b$	nan	$+1$	nan
$(-\infty, -1)$	$+0$	nan	$(-1)^b a ^b$	$+1$	$(-1)^b a ^b$	nan	$+\infty$	nan
$-\infty$	$+0$	$+0$	$(-1)^b 0$	$+1$	$(-1)^b \infty$	nan	$+\infty$	nan
nan	nan	nan	nan	$+1$	nan	nan	nan	nan

We distinguished in this table the cases of finite (positive or negative) integer exponents, as $(-1)^b$ is defined in that case. One peculiarity of this operation is that $\text{nan}^0 = 1^{\text{nan}} = 1$, because this relation is obeyed for any number, even $\pm\infty$.

`_fp_^_o:ww` We cram most of the tests into a single function to save csnames. First treat the case $b = 0$: $a^0 = 1$ for any a , even nan . Then test the sign of a .

- If it is positive, and a is a normal number, call `_fp_pow_normal_o:ww` followed by the two `fp` a and b . For $a = +0$ or $+\text{inf}$, call `_fp_pow_zero_or_inf:ww` instead, to return either $+0$ or $+\infty$ as appropriate.
- If a is a nan , then skip to the next `_fp_sep`: (which happens to be conveniently the end of b) and return nan .
- Finally, if a is negative, compute a^b (`_fp_pow_normal_o:ww` which ignores the sign of its first operand), and keep an extra copy of a and b (the second brace group, containing $\{ b a \}$, is inserted between a and b). Then do some tests to find the final sign of the result if it exists.

$\backslash_fp_pow_zero_or_inf:ww$

Raising -0 or $-\infty$ to nan yields nan . For other powers, the result is $+0$ if 0 is raised to a positive power or ∞ to a negative power, and $+\infty$ otherwise. Thus, if the type of a and the sign of b coincide, the result is 0 , since those conveniently take the same possible values, 0 and 2 . Otherwise, either $a = \pm\infty$ and $b > 0$ and the result is $+\infty$, or $a = \pm 0$ with $b < 0$ and we have a division by zero unless $b = -\infty$.

$\backslash_fp_pow_normal_o:ww$

We have in front of us a , and $b \neq 0$, we know that a is a normal number, and we wish to compute $|a|^b$. If $|a| = 1$, we return 1 , unless $a = -1$ and b is nan . Indeed, returning 1 at this point would wrongly raise “invalid” when the sign is considered. If $|a| \neq 1$, test the type of b :

0 Impossible, we already filtered $b = \pm 0$.

1 Call $\backslash_fp_pow_npos_o:Nww$.

2 Return $+\infty$ or $+0$ depending on the sign of b and whether the exponent of a is positive or not.

3 Return b .

(End of definition for __fp_pow_normal_o:ww.)

__fp_pow_npos_o:Nww We now know that $a \neq \pm 1$ is a normal number, and b is a normal number too. We want to compute $|a|^b = (|x| \cdot 10^n)^{y \cdot 10^p} = \exp((\ln|x| + n \ln(10)) \cdot y \cdot 10^p) = \exp(z)$. To compute the exponential accurately, we need to know the digits of z up to the 16-th position. Since the exponential of 10^5 is infinite, we only need at most 21 digits, hence the fixed point result of __fp_ln_o:w is precise enough for our needs. Start an integer expression for the decimal exponent of $e^{|z|}$. If z is negative, negate that decimal exponent, and prepare to take the inverse when converting from the fixed point to the floating point result.

__fp_pow_neg:www
__fp_pow_neg_aux:wNN

This function is followed by three floating point numbers: a^b , $a \in [-\infty, -0]$, and b . If b is an even integer (case -1), $a^b = a^b$. If b is an odd integer (case 0), $a^b = -a^b$, obtained by a call to __fp_pow_neg_aux:wNN. Otherwise, the sign is undefined. This is invalid, unless a^b turns out to be $+0$ or nan , in which case we return that as a^b . In particular, since the underflow detection occurs before __fp_pow_neg:www is called, $(-0.1)**(12345.67)$ gives $+0$ rather than complaining that the sign is not defined.

\_fp_pow_neg_case:w
\_fp_pow_neg_case_aux:nnnnn
\_fp_pow_neg_case_aux:Nnnw

```

This function expects a floating point number, and determines its “parity”. It should be used after \if_case:w or in an integer expression. It gives -1 if the number is an even integer, 0 if the number is an odd integer, and 1 otherwise. Zeros and $\pm\infty$ are even (because very large finite floating points are even), while `nan` is a non-integer. The sign of normal numbers is irrelevant to parity. After _fp_decimate:nNnnnn the argument #1 of _fp_pow_neg_case_aux:Nnnw is a rounding digit, 0 if and only if the number was an integer, and #3 is the 8 least significant digits of that integer.

79.4 Factorial

`\c__fp_fact_max_arg_int` The maximum integer whose factorial fits in the exponent range is 3248, as $3249! \sim 10^{10000.8}$

```

28243 \int_const:Nn \c__fp_fact_max_arg_int { 3248 }

```

(End of definition for `\c__fp_fact_max_arg_int`.)

`__fp_fact_o:w` First detect ± 0 and $+\infty$ and `nan`. Then note that factorial of anything with a negative sign (except -0) is undefined. Then call `__fp_small_int:wTF` to get an integer as the argument, and start a loop. This is not the most efficient way of computing the factorial, but it works all right. Of course we work with 24 digits instead of 16. It is easy to check that computing factorials with this precision is enough.

```

28244 \cs_new:Npn \__fp_fact_o:w #1 \s__fp \__fp_chk:w #2#3#4\__fp_sep: @
28245 {
28246   \if_case:w #2 \exp_stop_f:
28247     \__fp_case_return_o:Nw \c_one_fp
28248   \or:
28249   \or:
28250     \if_meaning:w 0 #3

28281 }

```

(End of definition for __fp_fact_pos_o:w and __fp_fact_int_o:w.)

__fp_fact_loop_o:w The loop receives an integer #1 whose factorial we want to compute, which we progressively decrement, and the result so far as an extended-precision number #2 in the form $\langle \text{exponent} \rangle, \langle \text{mantissa} \rangle \backslash_fp_sep:.$ The loop goes in steps of two because we compute $\#1 \cdot \#1 - 1$ as an integer expression (it must fit since #1 is at most 3248), then multiply with the result so far. We don't need to fill in most of the mantissa with zeros because __fp_ep_mul:wwwn first normalizes the extended precision number to avoid loss of precision. When reaching a small enough number simply use a table of factorials less than 10^8 . This limit is chosen because the normalization step cannot deal with larger integers.

80.1 Direct trigonometric functions

The approach for all trigonometric functions (sine, cosine, tangent, cotangent, cosecant, and secant), with arguments given in radians or in degrees, is the same.

- Filter out special cases (± 0 , $\pm \infty$ and **nan**).
- Keep the sign for later, and work with the absolute value $|x|$ of the argument.
- Small numbers ($|x| < 1$ in radians, $|x| < 10$ in degrees) are converted to fixed point numbers (and to radians if $|x|$ is in degrees).
- For larger numbers, we need argument reduction. Subtract a multiple of $\pi/2$ (in degrees, 90) to bring the number to the range to $[0, \pi/2)$ (in degrees, $[0, 90)$).
- Reduce further to $[0, \pi/4]$ (in degrees, $[0, 45]$) using $\sin x = \cos(\pi/2 - x)$, and when working in degrees, convert to radians.
- Use the appropriate power series depending on the octant $\lfloor \frac{x}{\pi/4} \rfloor \bmod 8$ (in degrees, the same formula with $\pi/4 \rightarrow 45$), the sign, and the function to compute.

80.1.1 Filtering special cases

`__fp_sin_o:w` This function, and its analogs for `cos`, `csc`, `sec`, `tan`, and `cot` instead of `sin`, are followed either by `\use_i:nn` and a float in radians or by `\use_ii:nn` and a float in degrees. The sine of ± 0 or **nan** is the same float. The sine of $\pm \infty$ raises an invalid operation exception with the appropriate function name. Otherwise, call the `trig` function to perform argument reduction and if necessary convert the reduced argument to radians. Then, `__fp_sin_series_o:NNwww` is called to compute the Taylor series: this function receives a sign `#3`, an initial octant of 0, and the function `__fp_ep_to_float_o:wwN` which converts the result of the series to a floating point directly rather than taking its inverse, since $\sin(x) = \#3 \sin|x|$.

```

28343 \cs_new:Npn \__fp_sin_o:w #1 \s__fp \__fp_chk:w #2#3#4\__fp_sep: @
28344 {
28345   \if_case:w #2 \exp_stop_f:
28346     \__fp_case_return_same_o:w
28347   \or: \__fp_case_use:nw
28348     {
28349       \__fp_trig:NNNNwn #1 \__fp_sin_series_o:NNwww
28350       \__fp_ep_to_float_o:wwN #3 0
28351     }
28352   \or: \__fp_case_use:nw
28353     { \__fp_invalid_operation_o:fw { #1 { sin } { sind } } }
28354   \else: \__fp_case_return_same_o:w
28355   \fi:
28356   \s__fp \__fp_chk:w #2 #3 #4\__fp_sep:
28357 }

```

(End of definition for `__fp_sin_o:w`.)

`__fp_cos_o:w` The cosine of ± 0 is 1. The cosine of $\pm \infty$ raises an invalid operation exception. The cosine of **nan** is itself. Otherwise, the `trig` function reduces the argument to at most half a right-angle and converts if necessary to radians. We then call the same series as

for sine, but using a positive sign 0 regardless of the sign of x , and with an initial octant of 2, because $\cos(x) = +\sin(\pi/2 + |x|)$.

```

28358 \cs_new:Npn \__fp_cos_o:w #1 \s__fp \__fp_chk:w #2#3\__fp_sep: @
28359 {
28360   \if_case:w #2 \exp_stop_f:
28361     \__fp_case_return_o:Nw \c_one_fp
28362   \or: \__fp_case_use:nw
28363     {
28364       \__fp_trig:NNNNNwn #1 \__fp_sin_series_o:NNwww

28366     }
28367   \or: \__fp_case_use:nw
28368     { \__fp_invalid_operation_o:fw { #1 { cos } { cosd } } }
28369   \else: \__fp_case_return_same_o:w
28370   \fi:
28371   \s__fp \__fp_chk:w #2 #3\__fp_sep:
28372 }

```

(End of definition for `__fp_cos_o:w`.)

`__fp_csc_o:w` The cosecant of ± 0 is $\pm\infty$ with the same sign, with a division by zero exception (see `__fp_cot_zero_o:Nfw` defined below), which requires the function name. The cosecant of $\pm\infty$ raises an invalid operation exception. The cosecant of `nan` is itself. Otherwise, the `trig` function performs the argument reduction, and converts if necessary to radians before calling the same series as for sine, using the sign `#3`, a starting octant of 0, and inverting during the conversion from the fixed point sine to the floating point result, because $\csc(x) = \#3(\sin|x|)^{-1}$.

```

28373 \cs_new:Npn \__fp_csc_o:w #1 \s__fp \__fp_chk:w #2#3#4\__fp_sep: @
28374 {
28375   \if_case:w #2 \exp_stop_f:

28383     { \__fp_invalid_operation_o:fw { #1 { csc } { cscd } } }
28384   \else: \__fp_case_return_same_o:w
28385   \fi:
28386   \s__fp \__fp_chk:w #2 #3 #4\__fp_sep:
28387 }

```

(End of definition for `__fp_csc_o:w`.)

`__fp_sec_o:w` The secant of ± 0 is 1. The secant of $\pm\infty$ raises an invalid operation exception. The secant of `nan` is itself. Otherwise, the `trig` function reduces the argument and turns it to radians before calling the same series as for sine, using a positive sign 0, a starting octant of 2, and inverting upon conversion, because $\sec(x) = +1/\sin(\pi/2 + |x|)$.

```

28388 \cs_new:Npn \__fp_sec_o:w #1 \s__fp \__fp_chk:w #2#3\__fp_sep: @
28389 {
28390   \if_case:w #2 \exp_stop_f:
28391     \__fp_case_return_o:Nw \c_one_fp

```

```

28392 \or: \__fp_case_use:nw
28393 {
28394     \__fp_trig:NNNNNwn #1 \__fp_sin_series_o:NNwww

28401 \s__fp \__fp_chk:w #2 #3\__fp_sep:
28402 }

```

(End of definition for __fp_sec_o:w.)

__fp_tan_o:w The tangent of ± 0 or `nan` is the same floating point number. The tangent of $\pm\infty$ raises an invalid operation exception. Once more, the `trig` function does the argument reduction step and conversion to radians before calling `__fp_tan_series_o:NNwww`, with a sign `#3` and an initial octant of 1 (this shift is somewhat arbitrary). See `__fp_cot_o:w` for an explanation of the 0 argument.

```

28403 \cs_new:Npn \__fp_tan_o:w #1 \s__fp \__fp_chk:w #2#3#4\__fp_sep: @
28404 {
28405     \if_case:w #2 \exp_stop_f:

28411         }
28412     \or: \__fp_case_use:nw
28413         { \__fp_invalid_operation_o:fw { #1 { tan } { tand } } }
28414     \else: \__fp_case_return_same_o:w
28415     \fi:
28416     \s__fp \__fp_chk:w #2 #3 #4\__fp_sep:
28417 }

```

(End of definition for __fp_tan_o:w.)

__fp_cot_o:w The cotangent of ± 0 is $\pm\infty$ with the same sign, with a division by zero exception (see `__fp_cot_zero_o:Nfw`). The cotangent of $\pm\infty$ raises an invalid operation exception. The cotangent of `nan` is itself. We use $\cot x = -\tan(\pi/2 + x)$, and the initial octant for the tangent was chosen to be 1, so the octant here starts at 3. The change in sign is obtained by feeding `__fp_tan_series_o:NNwww` two signs rather than just the sign of the argument: the first of those indicates whether we compute tangent or cotangent. Those signs are eventually combined.

```

28418 \cs_new:Npn \__fp_cot_o:w #1 \s__fp \__fp_chk:w #2#3#4\__fp_sep: @
28419 {

```

(End of definition for __fp_cot_o:w and __fp_cot_zero_o:Nfw.)

80.1.2 Distinguishing small and large arguments

__fp_trig:NNNNNwn

The first argument is \use_i:nn if the operand is in radians and \use_ii:nn if it is in degrees. Arguments #2 to #5 control what trigonometric function we compute, and #6 to #8 are pieces of a normal floating point number. Call the `_series` function #2, with arguments #3, either a conversion function (`__fp_ep_to_float_o:wN` or `__fp_ep_inv_to_float_o:wN`) or a sign 0 or 2 when computing tangent or cotangent; #4, a sign 0 or 2; the octant, computed in an integer expression starting with #5 and stopped by a period; and a fixed point number obtained from the floating point number by argument reduction (if necessary) and conversion to radians (if necessary). Any argument reduction adjusts the octant accordingly by leaving a (positive) shift into its integer expression. Let us explain the integer comparison. Two of the four `\exp_after:wN` are expanded, the expansion hits the test, which is true if the float is at least 1 when working in radians, and at least 10 when working in degrees. Then one of the remaining `\exp_after:wN` hits #1, which picks the `trig` or `trigd` function in whichever branch of the conditional was taken. The final `\exp_after:wN` closes the conditional. At the end of the day, a number is `large` if it is ≥ 1 in radians or ≥ 10 in degrees, and `small` otherwise. All four `trig/trigd` auxiliaries receive the operand as an extended-precision number.

```

28441 \cs_new:Npn \__fp_trig:NNNNNwn #1#2#3#4#5 \s__fp \__fp_chk:w 1#6#7#8\__fp_sep:
28442 {
28443     \exp_after:wN #2

28449     #1 \__fp_trig_large:ww \__fp_trigd_large:ww
28450     \else:
28451     #1 \__fp_trig_small:ww \__fp_trigd_small:ww
28452     \fi:
28453     #7,#8{0000}{0000}\__fp_sep:
28454 }

```

(End of definition for __fp_trig:NNNNNwn.)

80.1.3 Small arguments

`__fp_trig_small:ww` This receives a small extended-precision number in radians and converts it to a fixed point number. Some trailing digits may be lost in the conversion, so we keep the original floating point number around: when computing sine or tangent (or their inverses), the last step is to multiply by the floating point number (as an extended-precision number) rather than the fixed point number. The period serves to end the integer expression for the octant.

```
28455 \cs_new:Npn \__fp_trig_small:ww #1,#2\__fp_sep:

80.1.4 Argument reduction in degrees

`__fp_trigd_large:ww`
`__fp_trigd_large_auxi:nnnnwNNNN`
`__fp_trigd_large_auxii:wNw`
`__fp_trigd_large_auxiii:www`

Note that $25 \times 360 = 9000$, so $10^{k+1} \equiv 10^k \pmod{360}$ for $k \geq 3$. When the exponent `#1` is very large, we can thus safely replace it by 22 (or even 19). We turn the floating point number into a fixed point number with two blocks of 8 digits followed by five blocks of 4 digits. The original float is $100 \times \langle \text{block}_1 \rangle \cdots \langle \text{block}_3 \rangle . \langle \text{block}_4 \rangle \cdots \langle \text{block}_7 \rangle$, or is equal to it modulo 360 if the exponent `#1` is very large. The first auxiliary finds $\langle \text{block}_1 \rangle + \langle \text{block}_2 \rangle \pmod{9}$, a single digit, and prepends it to the 4 digits of $\langle \text{block}_3 \rangle$. It also unpacks $\langle \text{block}_4 \rangle$ and grabs the 4 digits of $\langle \text{block}_7 \rangle$. The second auxiliary grabs the $\langle \text{block}_3 \rangle$ plus any contribution from the first two blocks as `#1`, the first digit of $\langle \text{block}_4 \rangle$ (just after the decimal point in hundreds of degrees) as `#2`, and the three other digits as `#3`. It finds the quotient and remainder of `#1#2` modulo 9, adds twice the quotient to the integer expression for the octant, and places the remainder (between 0 and 8) before `#3` to form a new $\langle \text{block}_4 \rangle$. The resulting fixed point number is $x \in [0, 0.9]$. If $x \geq 0.45$, we add 1 to the octant and feed $0.9 - x$ with an exponent of 2 (to compensate the fact that we are working in units of hundreds of degrees rather than degrees) to `__fp_trigd_small:ww`. Otherwise, we feed it x with an exponent of 2. The third auxiliary also discards digits which were not packed into the various $\langle \text{blocks} \rangle$. Since the original exponent `#1` is at least 2, those are all 0 and no precision is lost (`#6` and `#7` are four 0 each).

80.1.5 Argument reduction in radians

Arguments greater or equal to 1 need to be reduced to a range where we only need a few terms of the Taylor series. We reduce to the range $[0, 2\pi]$ by subtracting multiples of 2π , then to the smaller range $[0, \pi/2]$ by subtracting multiples of $\pi/2$ (keeping track of how many times $\pi/2$ is subtracted), then to $[0, \pi/4]$ by mapping $x \rightarrow \pi/2 - x$ if appropriate. When the argument is very large, say, 10^{100} , an equally large multiple of 2π must be subtracted, hence we must work with a very good approximation of 2π in order to get a sensible remainder modulo 2π .

Specifically, we multiply the argument by an approximation of $1/(2\pi)$ with 10048 digits, then discard the integer part of the result, keeping 52 digits of the fractional part. From the fractional part of $x/(2\pi)$ we deduce the octant (quotient of the first three digits by 125). We then multiply by 8 or -8 (the latter when the octant is odd), ignore any integer part (related to the octant), and convert the fractional part to an extended precision number, before multiplying by $\pi/4$ to convert back to a value in radians in $[0, \pi/4]$.

It is possible to prove that given the precision of floating points and their range of exponents, the 52 digits may start at most with 24 zeros. The 5 last digits are

affected by carries from computations which are not done, hence we are left with at least $52 - 24 - 5 = 23$ significant digits, enough to round correctly up to $0.6 \cdot \text{ulp}$ in all cases.

`\c__fp_trig_intarray` This integer array stores blocks of 8 decimals of $10^{-16}/(2\pi)$. Each entry is 10^8 plus an 8 digit number storing 8 decimals. In total we store 10112 decimals of $10^{-16}/(2\pi)$. The number of decimals we really need is the maximum exponent plus the number of digits we later need, 52, plus 12 ($4 - 1$ groups of 4 digits). The memory footprint (1/2 byte per digit) is the same as an earlier method of storing the data as a control sequence name, but the major advantage is that we can unpack specific subsets of the digits without unpacking the 10112 decimals.

(End of definition for \c__fp_trig_intarray.)

__fp_trig_large:ww The exponent #1 is between 1 and 10000. We wish to look up decimals $10^{\#1-16}/(2\pi)$ starting from the digit #1 + 1. Since they are stored in batches of 8, compute $\lceil \#1/8 \rceil$ and fetch blocks of 8 digits starting there. The numbering of items in \c__fp_trig_intarray starts at 1, so the block $\lceil \#1/8 \rceil + 1$ contains the digit we want, at one of the eight positions. Each call to \int_value:w __kernel_intarray_item:Nn expands the next, until being stopped by __fp_trig_large_auxiii:w using \exp_stop_f:. Once all these blocks are unpacked, the \exp_stop_f: and 0 to 7 digits are removed by \use_none:n...n. Finally, __fp_trig_large_auxii:w packs 64 digits (there are between 65 and 72 at this point) into groups of 4 and the auxv auxiliary is called.

First come the first 64 digits of the fractional part of $10^{*1-16}/(2\pi)$, arranged in 16 blocks of 4, and ending with a _fp_sep:. Then a few more digits of the same fractional part, ending with a _fp_sep:, then 4 blocks of 4 digits holding the significand of the original argument. Multiply the 16-digit significand with the 64-digit fractional part: the auxvi auxiliary receives the significand as #2#3#4#5 and 16 digits of the fractional part as #6#7#8#9, and computes one step of the usual ladder of pack functions we use for multiplication (see e.g., _fp_fixed_mul:wwn), then discards one block of the fractional part to set things up for the next step of the ladder. We perform 13 such steps, replacing the last middle shift by the appropriate trailing shift, then discard the significand and remaining 3 blocks from the fractional part, as there are not enough digits to compute any more step in the ladder. The last _fp_sep: closes the ladder, and we return control to the auxvii auxiliary.

The `auxvii` auxiliary is followed by 52 digits and a `__fp_sep:`. We find the octant as the integer part of 8 times what follows, or equivalently as the integer part of `#1#2#3/125`, and add it to the surrounding integer expression for the octant. We then compute 8 times the 52-digit number, with a minus sign if the octant is odd. Again, the last `middle` shift is converted to a `trailing` shift. Any integer part (including negative values which come up when the octant is odd) is discarded by `__fp_use_i_until_s:nw`. The resulting fractional part should then be converted to radians by multiplying by $2\pi/8$, but first, build an extended precision number by abusing `__fp_ep_to_ep_loop:N` with the appropriate trailing markers. Finally, `__fp_trig_small:ww` sets up the argument for the functions which compute the Taylor series.

80.1.6 Computing the power series

__fp_sin_series_o:NNwww Here we receive a conversion function __fp_ep_to_float_o:wwN or __fp_ep_inv_to_float_o:wwN, a *sign* (0 or 2), a (non-negative) *octant* delimited by a dot, a *fixed point* number delimited by a __fp_sep:, and an extended-precision number. The auxiliary receives:

- the conversion function #1;
- the final sign, which depends on the octant #3 and the sign #2;
- the octant #3, which controls the series we use;
- the square #4 * #4 of the argument as a fixed point number, computed with __fp_fixed_mul:wwn;
- the number itself as an extended-precision number.

If the octant is in {1,2,5,6,...}, we are near an extremum of the function and we use the series

$$\cos(x) = 1 - x^2 \left(\frac{1}{2!} - x^2 \left(\frac{1}{4!} - x^2 \left(\dots \right) \right) \right).$$

Otherwise, the series

$$\sin(x) = x \left(1 - x^2 \left(\frac{1}{3!} - x^2 \left(\frac{1}{5!} - x^2 \left(\dots \right) \right) \right) \right)$$

is used. Finally, the extended-precision number is converted to a floating point number with the given sign, and __fp_sanitizew checks for overflow and underflow.

_fp_tan_series_o:NNwww
_fp_tan_series_aux_o:Nnwww

Contrarily to _fp_sin_series_o:NNwww which received a conversion auxiliary as #1, here, #1 is 0 for tangent and 2 for cotangent. Consider first the case of the tangent. The octant #3 starts at 1, which means that it is 1 or 2 for $|x| \in [0, \pi/2]$, it is 3 or 4 for $|x| \in [\pi/2, \pi]$, and so on: the intervals on which $\tan|x| \geq 0$ coincide with those for which $\lfloor (\#3 + 1)/2 \rfloor$ is odd. We also have to take into account the original sign of x to get the sign of the final result; it is straightforward to check that the first _int_value:w expansion produces 0 for a positive final result, and 2 otherwise. A similar story holds for $\cot(x)$.

The auxiliary receives the sign, the octant, the square of the (reduced) input, and the (reduced) input (an extended-precision number) as arguments. It then computes the numerator and denominator of

$$\tan(x) \simeq \frac{x(1 - x^2(a_1 - x^2(a_2 - x^2(a_3 - x^2(a_4 - x^2 a_5))))))}{1 - x^2(b_1 - x^2(b_2 - x^2(b_3 - x^2(b_4 - x^2 b_5)))}.$$

The ratio is computed by _fp_ep_div:www, then converted to a floating point number. For octants #3 (really, quadrants) next to a pole of the functions, the fixed point numerator and denominator are exchanged before computing the ratio. Note that this _if_int_odd:w test relies on the fact that the octant is at least 1.

80.2 Inverse trigonometric functions

All inverse trigonometric functions (arcsine, arccosine, arctangent, arccotangent, arcsecant, and arcsecant) are based on a function often denoted `atan2`. This function is accessed directly by feeding two arguments to `arctangent`, and is defined by $\text{atan}(y, x) = \text{atan}(y/x)$ for generic y and x . Its advantages over the conventional arctangent is that it takes values in $[-\pi, \pi]$ rather than $[-\pi/2, \pi/2]$, and that it is better behaved in boundary cases. Other inverse trigonometric functions are expressed in terms of `atan` as

$$\arccos x = \text{atan}(\sqrt{1 - x^2}, x) \quad (5)$$

$$\arcsin x = \text{atan}(x, \sqrt{1 - x^2}) \quad (6)$$

$$\text{asec } x = \text{atan}(\sqrt{x^2 - 1}, 1) \quad (7)$$

$$\text{acsc } x = \text{atan}(1, \sqrt{x^2 - 1}) \quad (8)$$

$$\text{atan } x = \text{atan}(x, 1) \quad (9)$$

$$\text{acot } x = \text{atan}(1, x). \quad (10)$$

Rather than introducing a new function, `atan2`, the arctangent function `atan` is overloaded: it can take one or two arguments. In the comments below, following many texts, we call the first argument y and the second x , because $\text{atan}(y, x) = \text{atan}(y/x)$ is the angular coordinate of the point (x, y) .

As for direct trigonometric functions, the first step in computing $\text{atan}(y, x)$ is argument reduction. The sign of y gives that of the result. We distinguish eight regions where the point $(x, |y|)$ can lie, of angular size roughly $\pi/8$, characterized by their “octant”, between 0 and 7 included. In each region, we compute an arctangent as a Taylor series, then shift this arctangent by the appropriate multiple of $\pi/4$ and sign to get the

result. Here is a list of octants, and how we compute the arctangent (we assume $y > 0$: otherwise replace y by $-y$ below):

- 0 $0 < |y| < 0.41421x$, then $\operatorname{atan} \frac{|y|}{x}$ is given by a nicely convergent Taylor series;
- 1 $0 < 0.41421x < |y| < x$, then $\operatorname{atan} \frac{|y|}{x} = \frac{\pi}{4} - \operatorname{atan} \frac{x-|y|}{x+|y|}$;
- 2 $0 < 0.41421|y| < x < |y|$, then $\operatorname{atan} \frac{|y|}{x} = \frac{\pi}{4} + \operatorname{atan} \frac{-x+|y|}{x+|y|}$;
- 3 $0 < x < 0.41421|y|$, then $\operatorname{atan} \frac{|y|}{x} = \frac{\pi}{2} - \operatorname{atan} \frac{x}{|y|}$;
- 4 $0 < -x < 0.41421|y|$, then $\operatorname{atan} \frac{|y|}{x} = \frac{\pi}{2} + \operatorname{atan} \frac{-x}{|y|}$;
- 5 $0 < 0.41421|y| < -x < |y|$, then $\operatorname{atan} \frac{|y|}{x} = \frac{3\pi}{4} - \operatorname{atan} \frac{x+|y|}{-x+|y|}$;
- 6 $0 < -0.41421x < |y| < -x$, then $\operatorname{atan} \frac{|y|}{x} = \frac{3\pi}{4} + \operatorname{atan} \frac{-x-|y|}{-x+|y|}$;
- 7 $0 < |y| < -0.41421x$, then $\operatorname{atan} \frac{|y|}{x} = \pi - \operatorname{atan} \frac{|y|}{-x}$.

In the following, we denote by z the ratio among $|\frac{y}{x}|$, $|\frac{x}{y}|$, $|\frac{x+y}{x-y}|$, $|\frac{x-y}{x+y}|$ which appears in the right-hand side above.

80.2.1 Arctangent and arccotangent

`__fp_atan_o:Nw` The parsing step manipulates `atan` and `acot` like `min` and `max`, reading in an array of operands, but also leaves `\use_i:nn` or `\use_ii:nn` depending on whether the result should be given in radians or in degrees. The helper `__fp_parse_function_one_two:nnw` checks that the operand is one or two floating point numbers (not tuples) and leaves its second argument or its tail accordingly (its first argument is used for error messages). More precisely if we are given a single floating point number `__fp_atan_default:w` places `\c_one_fp` (expanded) after it; otherwise `__fp_atan_default:w` is omitted by `__fp_parse_function_one_two:nnw`.

```

28965   { __fp_atan_default:w __fp_acotii_o:Nww #1 }
28966 }
28967 \cs_new:Npe __fp_atan_default:w #1#2#3 @ { #1 #2 #3 \c_one_fp @ }
```

(End of definition for `__fp_atan_o:Nw`, `__fp_acot_o:Nw`, and `__fp_atan_default:w`.)

`__fp_atanii_o:Nww` If either operand is `nan`, we return it. If both are normal, we call `__fp_atan_normal_o:NNnwNnw`. If both are zero or both infinity, we call `__fp_atan_inf_o:NNNw` with argument 2, leading to a result among $\{\pm\pi/4, \pm3\pi/4\}$ (in degrees, $\{\pm45, \pm135\}$). Otherwise, one is much bigger than the other, and we call `__fp_atan_inf_o:NNNw` with

either an argument of 4, leading to the values $\pm\pi/2$ (in degrees, ± 90), or 0, leading to $\{\pm 0, \pm\pi\}$ (in degrees, $\{\pm 0, \pm 180\}$). Since $\text{acot}(x, y) = \text{atan}(y, x)$, `_fp_acotii_o:ww` simply reverses its two arguments.

`_fp_atan_inf_o:NNNw` This auxiliary is called whenever one number is ± 0 or $\pm\infty$ (and neither is `nan`). Then the result only depends on the signs, and its value is a multiple of $\pi/4$. We use the same auxiliary as for normal numbers, `_fp_atan_combine_o:NwwwwN`, with arguments the final sign `#2`; the octant `#3`; $\text{atan } z/z = 1$ as a fixed point number; $z = 0$ as a fixed point number; and $z = 0$ as an extended-precision number. Given the values we provide, $\text{atan } z$ is computed to be 0, and the result is $[\#3/2] \cdot \pi/4$ if the sign `#5` of x is positive, and $[(7 - \#3)/2] \cdot \pi/4$ for negative x , where the divisions are rounded up.

```

```

(End of definition for `_fp_atan_inf_o:NNNw`.)

`_fp_atan_normal_o:NNnwNnw` Here we simply reorder the floating point data into a pair of signed extended-precision numbers, that is, a sign, an exponent ending with a comma, and a six-block mantissa ending with a `_fp_sep:.` This extended precision is required by other inverse trigonometric functions, to compute things like $\text{atan}(x, \sqrt{1 - x^2})$ without intermediate rounding errors.

```

__fp_atan_test_o:NwwNwwN

This receives: the sign #1 of y , its exponent #2, its 24 digits #3 in groups of 4, and similarly for x . We prepare to call __fp_atan_combine_o:NwwwwwN which expects the sign #1, the octant, the ratio $(\operatorname{atan} z)/z = 1 - \dots$, and the value of z , both as a fixed point number and as an extended-precision floating point number with a mantissa in $[0.01, 1)$. For now, we place #1 as a first argument, and start an integer expression for the octant. The sign of x does not affect z , so we simply leave a contribution to the octant: $\langle \text{octant} \rangle \rightarrow 7 - \langle \text{octant} \rangle$ for negative x . Then we order $|y|$ and $|x|$ in a non-decreasing order: if $|y| > |x|$, insert 3- in the expression for the octant, and swap the two numbers. The finer test with 0.41421 is done by __fp_atan_div:wnwwnw after the operands have been ordered.

```

__fp_atan_div:wnwwnw

__fp_atan_near:wwwN

__fp_atan_near_aux:wwN

This receives two positive numbers a and b (equal to $|x|$ and $|y|$ in some order), each as an exponent and 6 blocks of 4 digits, such that $0 < a < b$. If $0.41421b < a$, the two numbers are “near”, hence the point (y, x) that we started with is closer to the diagonals $\{|y| = |x|\}$ than to the axes $\{xy = 0\}$. In that case, the octant is 1 (possibly combined with the 7- and 3- inserted earlier) and we wish to compute $\operatorname{atan} \frac{b-a}{a+b}$. Otherwise, the octant is 0 (again, combined with earlier terms) and we wish to compute $\operatorname{atan} \frac{a}{b}$. In any case, call __fp_atan_auxi:ww followed by z , as a comma-delimited exponent and a fixed point number.

(End of definition for __fp_atan_auxi:ww and __fp_atan_auxii:w.)

__fp_atan_Taylor_loop:www We compute the series of $(\operatorname{atan} z)/z$. A typical intermediate stage has $\#1 = 2k - 1$,
 __fp_atan_Taylor_break:w $\#2 = \frac{1}{2k+1} - z^2(\frac{1}{2k+3} - z^2(\dots - z^2\frac{1}{39}))$, and $\#3 = z^2$. To go to the next step $k \rightarrow k - 1$,
 we compute $\frac{1}{2k-1}$, then subtract from it z^2 times $\#2$. The loop stops when $k = 0$: then
 $\#2$ is $(\operatorname{atan} z)/z$, and there is a need to clean up all the unnecessary data, end the integer
 expression computing the octant with a __fp_sep:, and leave the result $\#2$ afterwards.

\__fp_atan_combine_o:NwwwwN
\__fp_atan_combine_aux:ww

```

This receives a $\langle sign \rangle$, an $\langle octant \rangle$, a fixed point value of $(\operatorname{atan} z)/z$, a fixed point number z , and another representation of z , as an $\langle exponent \rangle$ and the fixed point number $10^{-\langle exponent \rangle} z$, followed by either `\use_i:nn` (when working in radians) or `\use_ii:nn` (when working in degrees). The function computes the floating point result

$$\langle sign \rangle \left(\left\lceil \frac{\langle octant \rangle}{2} \right\rceil \frac{\pi}{4} + (-1)^{\langle octant \rangle} \frac{\operatorname{atan} z}{z} \cdot z \right), \quad (11)$$

multiplied by $180/\pi$ if working in degrees, and using in any case the most appropriate representation of z . The floating point result is passed to `__fp_sanitize:Nw`, which checks for overflow or underflow. If the octant is 0, leave the exponent #5 for `__fp_sanitize:Nw`, and multiply $\#3 = \frac{\operatorname{atan} z}{z}$ with #6, the adjusted z . Otherwise, multiply $\#3 = \frac{\operatorname{atan} z}{z}$ with $\#4 = z$, then compute the appropriate multiple of $\frac{\pi}{4}$ and add or subtract the product $\#3 \cdot \#4$. In both cases, convert to a floating point with `__fp_fixed_to_float_o:wN`.

80.2.2 Arcsine and arccosine

`__fp_asin_o:w` Again, the first argument provided by `l3fp-parse` is `\use_i:nn` if we are to work in radians and `\use_ii:nn` for degrees. Then comes a floating point number. The arcsine of ± 0 or `nan` is the same floating point number. The arcsine of $\pm\infty$ raises an invalid operation exception. Otherwise, call an auxiliary common with `__fp_acos_o:w`, feeding it information about what function is being performed (for “invalid operation” exceptions).

```

29109 \cs_new:Npn \__fp_asin_o:w #1 \s__fp \__fp_chk:w #2#3\__fp_sep: @
29110 {
29111     \if_case:w #2 \exp_stop_f:
29112         \__fp_case_return_same_o:w
29113     \or:
29114         \__fp_case_use:nw
29115         { \__fp_asin_normal_o:NfwNnnnnw #1 { #1 { asin } { asind } } }
29116     \or:
29117         \__fp_case_use:nw
29118         { \__fp_invalid_operation_o:fw { #1 { asin } { asind } } }
29119     \else:
29120         \__fp_case_return_same_o:w
29121     \fi:
29122     \s__fp \__fp_chk:w #2 #3\__fp_sep:
29123 }

```

(End of definition for `__fp_asin_o:w`.)

`__fp_acos_o:w` The arccosine of ± 0 is $\pi/2$ (in degrees, 90). The arccosine of $\pm\infty$ raises an invalid operation exception. The arccosine of `nan` is itself. Otherwise, call an auxiliary common with `__fp_sin_o:w`, informing it that it was called by `acos` or `acosd`, and preparing to swap some arguments down the line.

```

29124 \cs_new:Npn \__fp_acos_o:w #1 \s__fp \__fp_chk:w #2#3\__fp_sep: @
29125 {
29126     \if_case:w #2 \exp_stop_f:
29127         \__fp_case_use:nw { \__fp_atan_inf_o:NNNw #1 0 4 }
29128     \or:
29129         \__fp_case_use:nw
29130         {
29131             \__fp_asin_normal_o:NfwNnnnnw #1 { #1 { acos } { acosd } }
29132             \__fp_reverse_args:Nww
29133         }
29134     \or:
29135         \__fp_case_use:nw
29136         { \__fp_invalid_operation_o:fw { #1 { acos } { acosd } } }
29137     \else:
29138         \__fp_case_return_same_o:w
29139     \fi:
29140     \s__fp \__fp_chk:w #2 #3\__fp_sep:
29141 }

```

(End of definition for `__fp_acos_o:w`.)

`__fp_asin_normal_o:NfwNnnnnw` If the exponent #5 is at most 0, the operand lies within $(-1, 1)$ and the operation is permitted: call `__fp_asin_auxi_o:NnNww` with the appropriate arguments. If the number is exactly ± 1 (the test works because we know that $\#5 \geq 1$, $\#6\#7 \geq 10000000$, $\#8\#9 \geq 0$, with equality only for ± 1), we also call `__fp_asin_auxi_o:NnNww`. Otherwise, `__fp_use_i:ww` gets rid of the `asin` auxiliary, and raises instead an invalid operation, because the operand is outside the domain of arcsine or arccosine.

```

29142 \cs_new:Npn __fp_asin_normal_o:NfwNnnnnw
29143   #1#2#3 \s__fp __fp_chk:w 1#4#5#6#7#8#9\__fp_sep:

29156   }

```

(End of definition for `__fp_asin_normal_o:NfwNnnnnw`.)

`__fp_asin_auxi_o:NnNww` We compute $x/\sqrt{1-x^2}$. This function is used by `asin` and `acos`, but also by `acsc` and `asec` after inverting the operand, thus it must manipulate extended-precision numbers. First evaluate $1-x^2$ as $(1+x)(1-x)$: this behaves better near $x = 1$. We do the addition/subtraction with fixed point numbers (they are not implemented for extended-precision floats), but go back to extended-precision floats to multiply and compute the inverse square root $1/\sqrt{1-x^2}$. Finally, multiply by the (positive) extended-precision float $|x|$, and feed the (signed) result, and the number +1, as arguments to the arctangent function. When computing the arccosine, the arguments $x/\sqrt{1-x^2}$ and +1 are swapped by #2 (`__fp_reverse_args:Nww` in that case) before `__fp_atan_test_o:NwwNwwN` is evaluated. Note that the arctangent function requires normalized arguments, hence the need for `ep_to_ep` and continue after `ep_mul`.

```

29157 \cs_new:Npn __fp_asin_auxi_o:NnNww #1#2#3#4,#5\__fp_sep:
29158   {

```

(End of definition for __fp_asin_auxi_o:NnNww and __fp_asin_isqrt:wn.)

80.2.3 Arc cosecant and arc secant

__fp_acsc_o:w Cases are mostly labelled by #2, except when #2 is 2: then we use #3#2, which is 02 = 2 when the number is $+\infty$ and 22 when the number is $-\infty$. The arc cosecant of ± 0 raises an invalid operation exception. The arc cosecant of $\pm\infty$ is ± 0 with the same sign. The arc cosecant of nan is itself. Otherwise, __fp_acsc_normal_o:NfwNnw does some more tests, keeping the function name (acsc or acscd) as an argument for invalid operation exceptions.

```

29176 \cs_new:Npn \__fp_acsc_o:w #1 \s__fp \__fp_chk:w #2#3#4\__fp_sep: @
29177 {
29178     \if_case:w \if_meaning:w 2 #2 #3 \fi: #2 \exp_stop_f:
29179         \__fp_case_use:nw
29180         { \__fp_invalid_operation_o:fw { #1 { acsc } { acscd } } }
29181     \or: \__fp_case_use:nw

Chapter 81

l3fp-convert implementation

```
29220 <*code>
29221 <@@=fp>
```

81.1 Dealing with tuples

```

    \__fp_tuple_convert:Nw
\__fp_tuple_convert_loop:nNw
    \__fp_tuple_convert_end:w

```

The first argument is for instance `__fp_to_tl_dispatch:w`, which converts any floating point object to the appropriate representation. We loop through all items, putting ,~ between all of them and making sure to remove the leading ,~.

```

29222 \cs_new:Npn \__fp_tuple_convert:Nw #1 \s__fp_tuple \__fp_tuple_chk:w #2 \__fp_sep:
29223 {
29224     \int_case:nnF { \__fp_array_count:n {#2} }
29225     {
29226         { 0 } { ( ) }
29227         { 1 } { \__fp_tuple_convert_end:w @ { #1 #2 , } }
29228     }
29229     {
29230         \__fp_tuple_convert_loop:nNw { } #1
29231         #2 { ? \__fp_tuple_convert_end:w } \__fp_sep:
29232         @ { \use_none:nn }
29233     }
29234 }
29235 \cs_new:Npn \__fp_tuple_convert_loop:nNw #1#2#3#4\__fp_sep: #5 @ #6
29236 {
29237     \use_none:n #3
29238     \exp_args:Nf \__fp_tuple_convert_loop:nNw { #2 #3#4 \__fp_sep: } #2 #5
29239     @ { #6 , ~ #1 }
29240 }
29241 \cs_new:Npn \__fp_tuple_convert_end:w #1 @ #2
29242 { \exp_after:wN ( \exp:w \exp_end_continue_f:w #2 ) }

```

(End of definition for `__fp_tuple_convert:Nw`, `__fp_tuple_convert_loop:nNw`, and `__fp_tuple_convert_end:w`.)

81.2 Trimming trailing zeros

```

    \__fp_trim_zeros:w
\__fp_trim_zeros_loop:w
    \__fp_trim_zeros_dot:w
    \__fp_trim_zeros_end:w

```

If #1 ends with a 0, the loop auxiliary takes that zero as an end-delimiter for its first argument, and the second argument is the same loop auxiliary. Once the last trailing

zero is reached, the second argument is the `dot` auxiliary, which removes a trailing dot if any. We then clean-up with the `end` auxiliary, keeping only the number.

```

29243 \cs_new:Npn \__fp_trim_zeros:w #1 \__fp_sep:
29244 {
29245     \__fp_trim_zeros_loop:w #1 \__fp_sep:
29246     \__fp_trim_zeros_loop:w 0\__fp_sep:
29247     \__fp_trim_zeros_dot:w .\__fp_sep:
29248     \s__fp_stop
29249 }
29250 \cs_new:Npn \__fp_trim_zeros_loop:w #1 0\__fp_sep: #2 { #2 #1 \__fp_sep: #2 }
29251 \cs_new:Npn \__fp_trim_zeros_dot:w #1 .\__fp_sep:
29252 { \__fp_trim_zeros_end:w #1 \__fp_sep: }
29253 \cs_new:Npn \__fp_trim_zeros_end:w #1 \__fp_sep: #2 \s__fp_stop { #1 }

```

(End of definition for `__fp_trim_zeros:w` and others.)

81.3 Scientific notation

`\fp_to_scientific:N` The three public functions evaluate their argument, then pass it to `__fp_to_scientific_dispatch:w`.

`\fp_to_scientific:c`

`\fp_to_scientific:n`

```

29254 \cs_new:Npn \fp_to_scientific:N #1
29255 { \exp_after:wN \__fp_to_scientific_dispatch:w #1 }
29256 \cs_generate_variant:Nn \fp_to_scientific:N { c }
29257 \cs_new:Npn \fp_to_scientific:n
29258 {
29259     \exp_after:wN \__fp_to_scientific_dispatch:w
29260     \exp:w \exp_end_continue_f:w \__fp_parse:n
29261 }

```

(End of definition for `\fp_to_scientific:N` and `\fp_to_scientific:n`. These functions are documented on page 268.)

`__fp_to_scientific_dispatch:w`

`__fp_to_scientific_recover:w`

`__fp_tuple_to_scientific:w`

We allow tuples.

```

29262 \cs_new:Npn \__fp_to_scientific_dispatch:w #1
29263 {
29264     \__fp_change_func_type:NNN
29265     #1 \__fp_to_scientific:w \__fp_to_scientific_recover:w
29266     #1
29267 }
29268 \cs_new:Npn \__fp_to_scientific_recover:w #1 #2 \__fp_sep:
29269 {
29270     \__fp_error:nffn { unknown-type } { \tl_to_str:n { #2 \__fp_sep: } } { } { }
29271     nan
29272 }
29273 \cs_new:Npn \__fp_tuple_to_scientific:w
29274 { \__fp_tuple_convert:Nw \__fp_to_scientific_dispatch:w }

```

(End of definition for `__fp_to_scientific_dispatch:w`, `__fp_to_scientific_recover:w`, and `__fp_tuple_to_scientific:w`.)

`__fp_to_scientific:w`

`__fp_to_scientific_normal:wmmmm`

`__fp_to_scientific_normal:wNw`

Expressing an internal floating point number in scientific notation is quite easy: no rounding, and the format is very well defined. First cater for the sign: negative numbers (`#2 = 2`) start with `-`; we then only need to care about positive numbers and `nan`. Then

filter the special cases: ± 0 are represented as 0; infinities are converted to a number slightly larger than the largest after an “invalid_operation” exception; nan is represented as 0 after an “invalid_operation” exception. In the normal case, decrement the exponent and unbrace the 4 brace groups, then in a second step grab the first digit (previously hidden in braces) to order the various parts correctly.

```

29275 \cs_new:Npn \__fp_to_scientific:w \s__fp \__fp_chk:w #1#2
29276 {
29277   \if_meaning:w 2 #2 \exp_after:wN - \exp:w \exp_end_continue_f:w \fi:
29278   \if_case:w #1 \exp_stop_f:

29307 { #2.#3 #1 }

```

(End of definition for __fp_to_scientific:w, __fp_to_scientific_normal:wnnnnn, and __fp_to_scientific_normal:wNw.)

81.4 Decimal representation

\fp_to_decimal:N All three public variants are based on the same __fp_to_decimal_dispatch:w after evaluating their argument to an internal floating point.

\fp_to_decimal:c

\fp_to_decimal:n

```

29308 \cs_new:Npn \fp_to_decimal:N #1
29309 { \exp_after:wN \__fp_to_decimal_dispatch:w #1 }
29310 \cs_generate_variant:Nn \fp_to_decimal:N { c }
29311 \cs_new:Npn \fp_to_decimal:n
29312 {
29313   \exp_after:wN \__fp_to_decimal_dispatch:w
29314   \exp:w \exp_end_continue_f:w \__fp_parse:n

```

```
29315 }
```

(End of definition for `\fp_to_decimal:N` and `\fp_to_decimal:n`. These functions are documented on page 267.)

```
\__fp_to_decimal_dispatch:w
\__fp_to_decimal_recover:w
\__fp_tuple_to_decimal:w
```

We allow tuples.

```
29316 \cs_new:Npn \__fp_to_decimal_dispatch:w #1
29317 {
29318   \__fp_change_func_type:NNN
29319   #1 \__fp_to_decimal:w \__fp_to_decimal_recover:w
29320   #1
29321 }
29322 \cs_new:Npn \__fp_to_decimal_recover:w #1 #2 \__fp_sep:
29323 {
29324   \__fp_error:nffn { unknown-type } { \tl_to_str:n { #2 \__fp_sep: } } { } { }
29325   nan
29326 }
29327 \cs_new:Npn \__fp_tuple_to_decimal:w
29328 { \__fp_tuple_convert:Nw \__fp_to_decimal_dispatch:w }
```

(End of definition for `__fp_to_decimal_dispatch:w`, `__fp_to_decimal_recover:w`, and `__fp_tuple_to_decimal:w`.)

```
\__fp_to_decimal:w
\__fp_to_decimal_normal:wnnnnn
\__fp_to_decimal_large:Nnnw
\__fp_to_decimal_huge:wnnnn
```

The structure is similar to `__fp_to_scientific:w`. Insert `-` for negative numbers. Zero gives 0, $\pm\infty$ and `nan` yield an “invalid operation” exception; note that $\pm\infty$ produces a very large output, which we don’t expand now since it most likely won’t be needed. Normal numbers with an exponent in the range $[1, 15]$ have that number of digits before the decimal separator: “decimate” them, and remove leading zeros with `\int_value:w`, then trim trailing zeros and dot. Normal numbers with an exponent 16 or larger have no decimal separator, we only need to add trailing zeros. When the exponent is non-positive, the result should be `0.<zeros><digits>`, trimmed.

```
29329 \cs_new:Npn \__fp_to_decimal:w \s__fp \__fp_chk:w #1#2
29330 {
29331   \if_meaning:w 2 #2 \exp_after:wN - \exp:w \exp_end_continue_f:w \fi:

```

(End of definition for __fp_to_decimal:w and others.)

81.5 Token list representation

\fp_to_tl:N These three public functions evaluate their argument, then pass it to __fp_to_tl_dispatch:w.
\fp_to_tl:c
\fp_to_tl:n

```

29387 \cs_new:Npn \fp_to_tl:N #1 { \exp_after:wN \__fp_to_tl_dispatch:w #1 }
29388 \cs_generate_variant:Nn \fp_to_tl:N { c }
29389 \cs_new:Npn \fp_to_tl:n
29390   {
29391     \exp_after:wN \__fp_to_tl_dispatch:w
29392     \exp:w \exp_end_continue_f:w \__fp_parse:n
29393   }

```

(End of definition for \fp_to_tl:N and \fp_to_tl:n. These functions are documented on page 268.)

__fp_to_tl_dispatch:w We allow tuples.
__fp_to_tl_recover:w
__fp_tuple_to_tl:w

```

29394 \cs_new:Npn \__fp_to_tl_dispatch:w #1
29395 { \__fp_change_func_type:NNN #1 \__fp_to_tl:w \__fp_to_tl_recover:w #1 }
29396 \cs_new:Npn \__fp_to_tl_recover:w #1 #2 \__fp_sep:
29397 {
29398   \__fp_error:nffn { unknown-type } { \tl_to_str:n { #2 \__fp_sep: } } { } { }
29399   nan
29400 }
29401 \cs_new:Npn \__fp_tuple_to_tl:w
29402 { \__fp_tuple_convert:Nw \__fp_to_tl_dispatch:w }

```

(End of definition for __fp_to_tl_dispatch:w, __fp_to_tl_recover:w, and __fp_tuple_to_tl:w.)

__fp_to_tl:w A structure similar to __fp_to_scientific_dispatch:w and __fp_to_decimal_dispatch:w, but without the “invalid operation” exception. First filter special cases. We express normal numbers in decimal notation if the exponent is in the range $[-2, 16]$, and otherwise use scientific notation.

```

29403 \cs_new:Npn \__fp_to_tl:w \s__fp \__fp_chk:w #1#2
29404 {
29405   \if_meaning:w 2 #2 \exp_after:wN - \exp:w \exp_end_continue_f:w \fi:
29406   \if_case:w #1 \exp_stop_f:
29407     \__fp_case_return:nw { 0 }
29408   \or: \exp_after:wN \__fp_to_tl_normal:nnnnn
29409   \or: \__fp_case_return:nw { inf }
29410   \else: \__fp_case_return:nw { nan }
29411   \fi:
29412 }
29413 \cs_new:Npn \__fp_to_tl_normal:nnnnn #1
29414 {
29415   \int_compare:nTF
29416     { -2 <= #1 <= \c__fp_prec_int }
29417     { \__fp_to_decimal_normal:wnnnnn }
29418     { \__fp_to_tl_scientific:wnnnnn }
29419   \s__fp \__fp_chk:w 1 0 {#1}
29420 }
29421 \cs_new:Npn \__fp_to_tl_scientific:wnnnnn
29422 \s__fp \__fp_chk:w 1 #1 #2 #3#4#5#6 \__fp_sep:
29423 {
29424   \exp_after:wN \__fp_to_tl_scientific:wNw
29425   \exp_after:wN e
29426   \int_value:w \__fp_int_eval:w #2 - 1
29427   \__fp_sep: #3 #4 #5 #6 \__fp_sep:
29428 }
29429 \cs_new:Npn \__fp_to_tl_scientific:wNw #1 \__fp_sep: #2#3\__fp_sep:
29430 { \__fp_trim_zeros:w #2.#3 \__fp_sep: #1 }

```

(End of definition for __fp_to_tl:w and others.)

81.6 Formatting

This is not implemented yet, as it is not yet clear what a correct interface would be, for this kind of structured conversion from a floating point (or other types of variables) to a string. Ideas welcome.

81.7 Convert to dimension or integer

\fp_to_dim:N All three public variants are based on the same `__fp_to_dim_dispatch:w` after evaluating their argument to an internal floating point. We only allow floating point numbers, not tuples.

\fp_to_dim:c
\fp_to_dim:n

```

\__fp_to_dim_dispatch:w 29431 \cs_new:Npn \fp_to_dim:N #1
\__fp_to_dim_recover:w 29432 { \exp_after:wN \__fp_to_dim_dispatch:w #1 }
\__fp_to_dim:w 29433 \cs_generate_variant:Nn \fp_to_dim:N { c }
29434 \cs_new:Npn \fp_to_dim:n
29435 {
29436   \exp_after:wN \__fp_to_dim_dispatch:w
29437   \exp:w \exp_end_continue_f:w \__fp_parse:n
29438 }
29439 \cs_new:Npn \__fp_to_dim_dispatch:w #1#2 \__fp_sep:
29440 {
29441   \__fp_change_func_type:NNN #1 \__fp_to_dim:w \__fp_to_dim_recover:w
29442   #1 #2 \__fp_sep:
29443 }
29444 \cs_new:Npn \__fp_to_dim_recover:w #1
29445 { \__fp_invalid_operation:nw { 0pt } { fp_to_dim } }
29446 \cs_new:Npn \__fp_to_dim:w #1 \__fp_sep: { \__fp_to_decimal:w #1 \__fp_sep: pt }
```

(End of definition for `\fp_to_dim:N` and others. These functions are documented on page 267.)

\fp_to_int:N For the most part identical to `\fp_to_dim:N` but without `pt`, and where `__fp_to_int:w` does more work. To convert to an integer, first round to 0 places (to the nearest integer), then express the result as a decimal number: the definition of `__fp_to_decimal_dispatch:w` is such that there are no trailing dot nor zero.

\fp_to_int:c
\fp_to_int:n

```

\__fp_to_int_dispatch:w 29447 \cs_new:Npn \fp_to_int:N #1 { \exp_after:wN \__fp_to_int_dispatch:w #1 }
\__fp_to_int_recover:w 29448 \cs_generate_variant:Nn \fp_to_int:N { c }
29449 \cs_new:Npn \fp_to_int:n
29450 {
29451   \exp_after:wN \__fp_to_int_dispatch:w
29452   \exp:w \exp_end_continue_f:w \__fp_parse:n
29453 }
29454 \cs_new:Npn \__fp_to_int_dispatch:w #1#2 \__fp_sep:
29455 {
29456   \__fp_change_func_type:NNN #1 \__fp_to_int:w \__fp_to_int_recover:w
29457   #1 #2 \__fp_sep:
29458 }
29459 \cs_new:Npn \__fp_to_int_recover:w #1
29460 { \__fp_invalid_operation:nw { 0 } { fp_to_int } }
29461 \cs_new:Npn \__fp_to_int:w #1\__fp_sep:
29462 {
29463   \exp_after:wN \__fp_to_decimal:w \exp:w \exp_end_continue_f:w
29464   \__fp_round:Nwn \__fp_round_to_nearest:NNN #1\__fp_sep: { 0 }
29465 }
```

(End of definition for `\fp_to_int:N` and others. These functions are documented on page 267.)

81.8 Convert from a dimension

\dim_to_fp:n The dimension expression (which can in fact be a glue expression) is evaluated, converted to a number (i.e., expressed in scaled points), then multiplied by $2^{-16} =$

```

\__fp_from_dim_test:w
\__fp_from_dim:wNw
\__fp_from_dim:wNNnnnnnn
\__fp_from_dim:wnnnnwNw
```

0.0000152587890625 to give a value expressed in points. The auxiliary `__fp_mul_npos_o:Nww` expects the desired *final sign* and two floating point operands (of the form `\s__fp ... __fp_sep:`) as arguments. This set of functions is also used to convert dimension registers to floating points while parsing expressions: in this context there is an additional exponent, which is the first argument of `__fp_from_dim_test:ww`, and is combined with the exponent -4 of 2^{-16} . There is also a need to expand afterwards: this is performed by `__fp_mul_npos_o:Nww`, and cancelled by `\prg_do_nothing:` here.

```

29466 \cs_new:Npn \dim_to_fp:n #1
29467 {
29468   \exp_after:wN \__fp_from_dim_test:ww
29469   \exp_after:wN 0

29499   \prg_do_nothing:
29500 }

```

(End of definition for `\dim_to_fp:n` and others. This function is documented on page 237.)

81.9 Use and eval

`\fp_use:N` Those public functions are simple copies of the decimal conversions.
`\fp_use:c` 29501 `\cs_new_eq:NN \fp_use:N \fp_to_decimal:N`
`\fp_eval:n` 29502 `\cs_generate_variant:Nn \fp_use:N { c }`
29503 `\cs_new_eq:NN \fp_eval:n \fp_to_decimal:n`

(End of definition for `\fp_use:N` and `\fp_eval:n`. These functions are documented on page 268.)

\fp_sign:n Trivial but useful. See the implementation of \fp_add:Nn for an explanation of why to use __fp_parse:n, namely, for better error reporting.

```
29504 \cs_new:Npn \fp_sign:n #1
29505 { \fp_to_decimal:n { sign \__fp_parse:n {#1} } }
```

(End of definition for \fp_sign:n. This function is documented on page 267.)

\fp_abs:n Trivial but useful. See the implementation of \fp_add:Nn for an explanation of why to use __fp_parse:n, namely, for better error reporting.

```
29506 \cs_new:Npn \fp_abs:n #1
29507 { \fp_to_decimal:n { abs \__fp_parse:n {#1} } }
```

(End of definition for \fp_abs:n. This function is documented on page 286.)

\fp_max:nn Similar to \fp_abs:n, for consistency with \int_max:nn, etc.

\fp_min:nn

```
29508 \cs_new:Npn \fp_max:nn #1#2
29509 { \fp_to_decimal:n { max ( \__fp_parse:n {#1} , \__fp_parse:n {#2} ) } }
29510 \cs_new:Npn \fp_min:nn #1#2
29511 { \fp_to_decimal:n { min ( \__fp_parse:n {#1} , \__fp_parse:n {#2} ) } }
```

(End of definition for \fp_max:nn and \fp_min:nn. These functions are documented on page 286.)

81.10 Convert an array of floating points to a comma list

__fp_array_to_clist:n Converts an array of floating point numbers to a comma-list. If speed here ends up irrelevant, we can simplify the code for the auxiliary to become

```
\cs_new:Npn \__fp_array_to_clist_loop:Nw #1#2;
{
  \use_none:n #1
  { , ~ } \fp_to_tl:n { #1 #2 ; }
  \__fp_array_to_clist_loop:Nw
}
```

The \use_ii:nn function is expanded after __fp_expand:n is done, and it removes ,~ from the start of the representation.

```
29512 \cs_new:Npn \__fp_array_to_clist:n #1
29513 {
29514   \tl_if_empty:nF {#1}
29515   {
29516     \exp_last_unbraced:Ne \use_ii:nn
29517     {
29518       \__fp_array_to_clist_loop:Nw #1 { ? \prg_break: } \__fp_sep:
29519       \prg_break_point:
29520     }
29521   }
29522 }
29523 \cs_new:Npn \__fp_array_to_clist_loop:Nw #1#2\__fp_sep:
29524 {
29525   \use_none:n #1
29526   , ~
```

```

29527     \exp_not:f { \__fp_to_tl_dispatch:w #1 #2 \__fp_sep: }
29528     \__fp_array_to_clist_loop:Nw
29529   }

(End of definition for \__fp_array_to_clist:n and \__fp_array_to_clist_loop:Nw.)

(End of definition for \_fp_parse_word_rand:N and \_fp_parse_word_randint:N.)
```

82.1 Engine support

Obviously, every word “random” below means “pseudo-random”, as we have no access to entropy (except a very unreliable source of entropy: the time it takes to run some code).

The primitive random number generator (RNG) is provided as `\tex_uniformdeviate:D`. Under the hood, it maintains an array of 55 28-bit numbers, updated with a linear recursion relation (similar to Fibonacci numbers) modulo 2^{28} . When `\tex_uniformdeviate:D` (`<integer>`) is called (for brevity denote by N the `<integer>`), the next 28-bit number is read from the array, scaled by $N/2^{28}$, and rounded. To prevent 0 and N from appearing half as often as other numbers, they are both mapped to the result 0.

This process means that `\tex_uniformdeviate:D` only gives a uniform distribution from 0 to $N-1$ if N is a divisor of 2^{28} , so we will mostly call the RNG with such power of 2 arguments. If N does not divide 2^{28} , then the relative non-uniformity (difference between probabilities of getting different numbers) is about $N/2^{28}$. This implies that detecting deviation from $1/N$ of the probability of a fixed value X requires about $2^{56}/N$ random trials. But collective patterns can reduce this to about $2^{56}/N^2$. For instance with $N = 3 \times 2^k$, the modulo 3 repartition of such random numbers is biased with a non-uniformity about $2^k/2^{28}$ (which is much worse than the circa $3/2^{28}$ non-uniformity from taking directly $N = 3$). This is detectable after about $2^{56}/2^{2k} = 9 \cdot 2^{56}/N^2$ random numbers. For $k = 15$, $N = 98304$, this means roughly 2^{26} calls to the RNG (experimentally this takes at the very least 16 seconds on a 2 giga-hertz processor). While this bias is not quite problematic, it is uncomfortably close to being so, and it becomes worse as N is increased. In our code, we shall thus combine several results from the RNG.

The RNG has three types of unexpected correlations. First, everything is linear modulo 2^{28} , hence the lowest k bits of the random numbers only depend on the lowest k bits of the seed (and of course the number of times the RNG was called since setting the seed). The recommended way to get a number from 0 to $N - 1$ is thus to scale the raw 28-bit integer, as the engine's RNG does. We will go further and in fact typically we discard some of the lowest bits.

Second, suppose that we call the RNG with the same argument N to get a set of K integers in $[0, N - 1]$ (throwing away repeats), and suppose that $N > K^3$ and $K > 55$. The recursion used to construct more 28-bit numbers from previous ones is linear: $x_n = x_{n-55} - x_{n-24}$ or $x_n = x_{n-55} - x_{n-24} + 2^{28}$. After rescaling and rounding we find that the result $N_n \in [0, N - 1]$ is among $N_{n-55} - N_{n-24} + \{-1, 0, 1\}$ modulo N (a more detailed analysis shows that 0 appears with frequency close to $3/4$). The resulting set thus has more triplets (a, b, c) than expected obeying $a = b + c$ modulo N . Namely it will have of order $(K - 55) \times 3/4$ such triplets, when one would expect $K^3/(6N)$. This starts to be detectable around $N = 2^{18} > 55^3$ (earlier if one keeps track of positions too, but this is more subtle than it looks because the array of 28-bit integers is read backwards by the engine). Hopefully the correlation is subtle enough to not affect realistic documents so we do not specifically mitigate against this. Since we typically use two calls to the RNG per `\int_rand:nn` we would need to investigate linear relations between the x_{2n} on the one hand and between the x_{2n+1} on the other hand. Such relations will have more complicated coefficients than ± 1 , which alleviates the issue.

Third, consider successive batches of 165 calls to the RNG (with argument 2^{28} or with argument 2 for instance), then most batches have more odd than even numbers. Note that this does not mean that there are more odd than even numbers overall. Similar issues are discussed in Knuth's TAOCP volume 2 near exercise 3.3.2-31. We do not have any mitigation strategy for this.

Ideally, our algorithm should be:

- Uniform. The result should be as uniform as possible assuming that the RNG's underlying 28-bit integers are uniform.
- Uncorrelated. The result should not have detectable correlations between different seeds, similar to the lowest-bit ones mentioned earlier.
- Quick. The algorithm should be fast in \TeX , so no “bit twiddling”, but “digit twiddling” is ok.
- Simple. The behaviour must be documentable precisely.
- Predictable. The number of calls to the RNG should be the same for any `\int_rand:nn`, because then the algorithm can be modified later without changing the result of other uses of the RNG.
- Robust. It should work even for `\int_rand:nn { - \c_max_int } { \c_max_int }` where the range is not representable as an integer. In fact, we also provide later a floating-point `randint` whose range can go all the way up to $2 \times 10^{16} - 1$ possible values.

Some of these requirements conflict. For instance, uniformity cannot be achieved with a fixed number of calls to the RNG.

Denote by `random(N)` one call to `\tex_uniformdeviate:D` with argument N , and by `ediv(p, q)` the ε - \TeX rounding division giving $\lfloor p/q + 1/2 \rfloor$. Denote by $\langle \min \rangle$, $\langle \max \rangle$

and $R = \langle \text{max} \rangle - \langle \text{min} \rangle + 1$ the arguments of `\int_min:nn` and the number of possible outcomes. Note that $R \in [1, 2^{32} - 1]$ cannot necessarily be represented as an integer (however, $R - 2^{31}$ can). Our strategy is to get two 28-bit integers X and Y from the RNG, split each into 14-bit integers, as $X = X_1 \times 2^{14} + X_0$ and $Y = Y_1 \times 2^{14} + Y_0$ then return essentially $\langle \text{min} \rangle + \lfloor R(X_1 \times 2^{-14} + Y_1 \times 2^{-28} + Y_0 \times 2^{-42} + X_0 \times 2^{-56}) \rfloor$. For small R the X_0 term has a tiny effect so we ignore it and we can compute $R \times Y/2^{28}$ much more directly by `random(R)`.

- If $R \leq 2^{17} - 1$ then return $\text{ediv}(R \text{ random}(2^{14}) + \text{random}(R) + 2^{13}, 2^{14}) - 1 + \langle \text{min} \rangle$. The shifts by 2^{13} and -1 convert $\varepsilon\text{-TeX}$ division to truncated division. The bound on R ensures that the number obtained after the shift is less than `\c_max_int`. The non-uniformity is at most of order $2^{17}/2^{42} = 2^{-25}$.
- Split $R = R_2 \times 2^{28} + R_1 \times 2^{14} + R_0$, where $R_2 \in [0, 15]$. Compute $\langle \text{min} \rangle + R_2 X_1 2^{14} + (R_2 Y_1 + R_1 X_1) + \text{ediv}(R_2 Y_0 + R_1 Y_1 + R_0 X_1 + \text{ediv}(R_2 X_0 + R_0 Y_1 + \text{ediv}((2^{14} R_1 + R_0)(2^{14} Y_0 + X_0), 2^{28}), 2^{14}), 2^{14})$ then map a result of $\langle \text{max} \rangle + 1$ to $\langle \text{min} \rangle$. Writing each `ediv` in terms of truncated division with a shift, and using $\lfloor (p + \lfloor r/s \rfloor)/q \rfloor = \lfloor (ps + r)/(sq) \rfloor$, what we compute is equal to $\lfloor \langle \text{exact} \rangle + 2^{-29} + 2^{-15} + 2^{-1} \rfloor$ with $\langle \text{exact} \rangle = \langle \text{min} \rangle + R \times 0.X_1 Y_1 Y_0 X_0$. Given we map $\langle \text{max} \rangle + 1$ to $\langle \text{min} \rangle$, the shift has no effect on uniformity. The non-uniformity is bounded by $R/2^{56} < 2^{-24}$. It may be possible to speed up the code by dropping tiny terms such as $R_0 X_0$, but the analysis of non-uniformity proves too difficult.

To avoid the overflow when the computation yields $\langle \text{max} \rangle + 1$ with $\langle \text{max} \rangle = 2^{31} - 1$ (note that R is then arbitrary), we compute the result in two pieces. Compute $\langle \text{first} \rangle = \langle \text{min} \rangle + R_2 X_1 2^{14}$ if $R_2 < 8$ or $\langle \text{min} \rangle + 8 X_1 2^{14} + (R_2 - 8) X_1 2^{14}$ if $R_2 \geq 8$, the expressions being chosen to avoid overflow. Compute $\langle \text{second} \rangle = R_2 Y_1 + R_1 X_1 + \text{ediv}(\dots)$, at most $R_2 2^{14} + R_1 2^{14} + R_0 \leq 2^{28} + 15 \times 2^{14} - 1$, not at risk of overflowing. We have $\langle \text{first} \rangle + \langle \text{second} \rangle = \langle \text{max} \rangle + 1 = \langle \text{min} \rangle + R$ if and only if $\langle \text{second} \rangle = R 2^{14} + R_0 + R_2 2^{14}$ and $2^{14} R_2 X_1 = 2^{28} R_2 - 2^{14} R_2$ (namely $R_2 = 0$ or $X_1 = 2^{14} - 1$). In that case, return $\langle \text{min} \rangle$, otherwise return $\langle \text{first} \rangle + \langle \text{second} \rangle$, which is safe because it is at most $\langle \text{max} \rangle$. Note that the decision of what to return does not need $\langle \text{first} \rangle$ explicitly so we don't actually compute it, just put it in an integer expression in which $\langle \text{second} \rangle$ is eventually added (or not).

- To get a floating point number in $[0, 1)$ just call the $R = 10000 \leq 2^{17} - 1$ procedure above to produce four blocks of four digits.
- To get an integer floating point number in a range (whose size can be up to $2 \times 10^{16} - 1$), work with fixed-point numbers: get six times four digits to build a fixed point number, multiply by R and add $\langle \text{min} \rangle$. This requires some care because `l3fp-extended` only supports non-negative numbers.

`\c__kernel_randint_max_int` Constant equal to $2^{17} - 1$, the maximal size of a range that `\int_range:nn` can do with its “simple” algorithm.

29537 `\int_const:Nn \c__kernel_randint_max_int { 131071 }`

(End of definition for `\c__kernel_randint_max_int`.)

`__kernel_randint:n` Used in an integer expression, `__kernel_randint:n {R}` gives a random number $1 + \lfloor (R \text{ random}(2^{14}) + \text{random}(R))/2^{14} \rfloor$ that is in $[1, R]$. Previous code was computing $\lfloor p/2^{14} \rfloor$ as $\text{ediv}(p - 2^{13}, 2^{14})$ but that wrongly gives -1 for $p = 0$.

```

29538 \cs_new:Npn \__kernel_randint:n #1
29539 {
29540   (#1 * \tex_uniformdeviate:D 16384
29541     + \tex_uniformdeviate:D #1 + 8192 ) / 16384
29542 }

```

(End of definition for __kernel_randint:n.)

__fp_rand_myriads:n Used as __fp_rand_myriads:n {XXX} with one letter X (specifically) per block of four digit we want; it expands to __fp_sep: followed by the requested number of brace groups, each containing four (pseudo-random) digits. Digits are produced as a random number in [10000, 19999] for the usual reason of preserving leading zeros.

```

29543 \cs_new:Npn \__fp_rand_myriads:n #1
29544 { \__fp_rand_myriads_loop:w #1 \prg_break: X \prg_break_point: \__fp_sep: }
29545 \cs_new:Npn \__fp_rand_myriads_loop:w #1 X
29546 {
29547   #1
29548   \exp_after:wN \__fp_rand_myriads_get:w
29549   \int_value:w \__fp_int_eval:w 9999 +
29550   \__kernel_randint:n { 10000 }
29551   \__fp_rand_myriads_loop:w
29552 }
29553 \cs_new:Npn \__fp_rand_myriads_get:w 1 #1 \__fp_sep: { \__fp_sep: {#1} }

```

(End of definition for __fp_rand_myriads:n, __fp_rand_myriads_loop:w, and __fp_rand_myriads_get:w.)

82.2 Random floating point

__fp_rand_o:Nw First we check that random was called without argument. Then get four blocks of four digits and convert that fixed point number to a floating point number (this correctly sets the exponent). This has a minor bug: if all of the random numbers are zero then the result is correctly 0 but it raises the underflow flag; it should not do that.

```

29554 \cs_new:Npn \__fp_rand_o:Nw ? #1 @
29555 {
29556   \tl_if_empty:nTF {#1}
29557   {
29558     \exp_after:wN \__fp_rand_o:w
29559     \exp:w \exp_end_continue_f:w
29560     \__fp_rand_myriads:n { XXXX } { 0000 } { 0000 } \__fp_sep: 0
29561   }
29562   {
29563     \__fp_error_num_args:ffff { rand } { 0 } { 0 }
29564     { \__fp_array_count:n {#1} }
29565     \exp_after:wN \c_nan_fp
29566   }
29567 }
29568 \cs_new:Npn \__fp_rand_o:w \__fp_sep:
29569 {
29570   \exp_after:wN \__fp_sanitize:Nw
29571   \exp_after:wN 0
29572   \int_value:w \__fp_int_eval:w \c_zero_int
29573   \__fp_fixed_to_float_o:wN
29574 }

```

(End of definition for `__fp_rand_o:Nw` and `__fp_rand_o:w`.)

82.3 Random integer

```

__fp_randint_o:Nw
__fp_randint_default:w
__fp_randint_badarg:w
__fp_randint_o:w
__fp_randint_auxi_o:ww
__fp_randint_auxii:wn
__fp_randint_auxiii_o:ww
__fp_randint_auxiv_o:ww
__fp_randint_auxv_o:w

```

Enforce that there is one argument (then add first argument 1) or two arguments. Call `__fp_randint_badarg:w` on each; this function inserts 1 `\exp_stop_f:` to end the `\if_case:w` statement if either the argument is not an integer or if its absolute value is $\geq 10^{16}$. Also bail out if `__fp_compare_back:ww` yields 1, meaning that the bounds are not in the right order. Otherwise an auxiliary converts each argument times 10^{-16} (hence the shift in exponent) to a 24-digit fixed point number (see `l3fp-extended`). Then compute the number of choices, $\langle max \rangle + 1 - \langle min \rangle$. Create a random 24-digit fixed-point number with `__fp_rand_myriads:n`, then use a fused multiply-add instruction to multiply the number of choices to that random number and add it to $\langle min \rangle$. Then truncate to 16 digits (namely select the integer part of 10^{16} times the result) before converting back to a floating point number (`__fp_sanitize:Nw` takes care of zero). To avoid issues with negative numbers, add 1 to all fixed point numbers (namely 10^{16} to the integers they represent), except of course when it is time to convert back to a float.

```

29683 }

```

(End of definition for __fp_randint_o:Nw and others.)

\int_rand:nn Evaluate the argument and filter out the case where the lower bound #1 is more than the upper bound #2. Then determine whether the range is narrower than \c__kernel_randint_max_int; #2-#1 may overflow for very large positive #2 and negative #1. If the range is narrow, call __kernel_randint:n {⟨choices⟩} where ⟨choices⟩ is the number of possible outcomes. If the range is wide, use somewhat slower code.

__fp_randint:ww

```

29684 \cs_new:Npn \int_rand:nn #1#2
29685 {
29686     \int_eval:n

```

```

29710         - 1 + #1
29711     \else:
29712         \__kernel_randint:nn {#1} {#2}
29713     \fi:
29714 \fi:
29715 }

```

(End of definition for \int_rand:nn and __fp_randint:ww. This function is documented on page 184.)

Any $n \in [-2^{31} + 1, 2^{31} - 1]$ is uniquely written as $2^{14}n_1 + n_2$ with $n_1 \in [-2^{17}, 2^{17} - 1]$ and $n_2 \in [0, 2^{14} - 1]$. Calling __fp_randint_split_o:Nw n __fp_sep: gives n_1 __fp_sep: n_2 __fp_sep: and expands the next token once. We do this for two random numbers and apply __fp_randint_split_o:Nw twice to fully decompose the range R . One subtlety is that we compute $R - 2^{31} = \langle \max \rangle - \langle \min \rangle - (2^{31} - 1) \in [-2^{31} + 1, 2^{31} - 1]$ rather than R to avoid overflow.

Then we have __fp_randint_wide_aux:w $\langle X_1 \rangle$ __fp_sep: $\langle X_0 \rangle$ __fp_sep: $\langle Y_1 \rangle$ __fp_sep: $\langle Y_0 \rangle$ __fp_sep: $\langle R_2 \rangle$ __fp_sep: $\langle R_1 \rangle$ __fp_sep: $\langle R_0 \rangle$ __fp_sep: . and we apply the algorithm described earlier.

Chapter 83

l3fp-types implementation

```
29801 <code>
29802 <@@=fp>
```

83.1 Support for types

Despite lack of documentation, the l3fp internals support types. Each additional type must define

- `\s__fp_<type>` and `__fp_<type>_chk:w`;
- `__fp_exp_after_<type>_f:nw`;
- `__fp_<type>_to_<out>:w` for `<out>` among `decimal`, `scientific`, `tl`;

and may define

- `__fp_<type>_to_int:w` and `__fp_<type>_to_dim:w`;
- `__fp_<op>_<type>_o:w` for any of the `<op>` that the type implements, among `acos`, `acsc`, `asec`, `asin`, `cos`, `cot`, `csc`, `exp`, `ln`, `not`, `sec`, `set_sign`, `sin`, `tan`;
- `__fp_<type1>_<op>_<type2>_o:ww` for `<op>` among `^*/-+&|` and for every pair of types;
- `__fp_<type1>_bcmp_<type2>:ww` for every pair of types.

The latter is set up in l3fp-logic.

83.2 Dispatch according to the type

```
\__fp_types_cs_to_op:N From \__fp_<op>_o:w produce <op>, otherwise ?.

Chapter 84

l3fp-symbolic implementation

29860 $\langle *code \rangle$

29861 $\langle @@=fp \rangle$

84.1 Misc

`\l__fp_symbolic_fp` Scratch floating point.

29862 `\fp_new:N \l__fp_symbolic_fp`

(End of definition for \l__fp_symbolic_fp.)

84.2 Building blocks for expressions

Every symbolic expression has the form `\s__fp_symbolic __fp_symbolic_chk:w $\langle operation \rangle$, { $\langle operands \rangle$ } $\langle junk \rangle$ __fp_sep:` where the $\langle operation \rangle$ is a list of N-type tokens, the $\langle operands \rangle$ is an array of floating point objects, and the $\langle junk \rangle$ (typically empty) is to be discarded. If the outermost operator (last to be evaluated) is unary, the expression has the form

```
\s__fp_symbolic \__fp_symbolic_chk:w
\__fp_types_unary:NNw \__fp_<op>_o:w <token> ,
{ <operand> } <junk> \__fp_sep:
```

where the $\langle op \rangle$ is a unary operation (`set_sign`, `cos`, ...), and the $\langle token \rangle$ and $\langle operand \rangle$ are used as arguments for `__fp_<op>_o:w` (or the type-specific analog of this function). If the outermost operator is binary, the expression has the form

```
\s__fp_symbolic \__fp_symbolic_chk:w
\__fp_types_binary:Nww \__fp_<op>_o:ww ,
{ <operand1> <operand2> } <junk> \__fp_sep:
```

where the $\langle op \rangle$ is an operation (`+`, `&`, ...), and `__fp_<op>_o:ww` receives the $\langle operands \rangle$ as arguments. If the expression is a user-defined function applied to some arguments it is stored as

```
\s__fp_symbolic \__fp_symbolic_chk:w
\__fp_function_o:w \__fp_<identifier>_o:w ,
{ <operands> } <junk> \__fp_sep:
```

If the expression consists of a single variable, it is stored as

```
\s__fp_symbolic \__fp_symbolic_chk:w
\__fp_variable_o:w <identifier> ,
{ } <junk> \__fp_sep:
```

Symbolic expressions are stored in a prefix form. When encountering a symbolic expression in a floating point computation, we attempt to evaluate the operands as much as possible, and if that yields floating point numbers rather than expressions, we apply the operator which follows (if the function is known).

For instance, the expression $a + b * \sin(c)$ is stored as

```
\s__fp_symbolic \__fp_symbolic_chk:w
\__fp_types_binary:Nww \__fp+_o:ww ,
{
  \s__fp_symbolic \__fp_symbolic_chk:w
  \__fp_variable_o:w a , { } \__fp_sep:
  \s__fp_symbolic \__fp_symbolic_chk:w
  \__fp_types_binary:Nww \__fp*_o:ww ,
  {
    \s__fp_symbolic \__fp_symbolic_chk:w
    \__fp_variable_o:w b , { } \__fp_sep:
    \s__fp_symbolic \__fp_symbolic_chk:w
    \__fp_types_unary:NNw \__fp_sin_o:w \use_i:nn ,
    {
      \s__fp_symbolic \__fp_symbolic_chk:w
      \__fp_variable_o:w c , { } \__fp_sep:
    } \__fp_sep:
  } \__fp_sep:
} \__fp_sep:
```

\s__fp_symbolic Scan mark indicating the start of a symbolic expression.

29863 \scan_new:N \s__fp_symbolic

(End of definition for \s__fp_symbolic.)

__fp_symbolic_chk:w Analog of __fp_chk:w for symbolic expressions.

```
29864 \cs_new_protected:Npn \__fp_symbolic_chk:w #1,#2#3\__fp_sep:
29865 {
29866   \msg_error:nne { fp } { misused-fp }
29867   {
29868     \__fp_to_tl_dispatch:w
29869     \s__fp_symbolic \__fp_symbolic_chk:w #1,{#2}\__fp_sep:
29870   }
29871 }
```

(End of definition for __fp_symbolic_chk:w.)

84.3 Expanding after a symbolic expression

`_fp_if_has_symbolic:nTF` Tests if #1 contains `\s_fp_symbolic` at top-level. This test should be precise enough to determine if a given array contains a symbolic expression or only consists of floating points. Used in `_fp_exp_after_symbolic_f:nw`.

```

29872 \cs_new:Npn \_fp_if_has_symbolic:nTF #1
29873 {
29874   \_fp_if_has_symbolic_aux:w
29875   #1 \s\_fp_mark \use_i:nn
29876   \s\_fp_symbolic \s\_fp_mark \use_ii:nn
29877   \s\_fp_stop
29878 }
29879 \cs_new:Npn \_fp_if_has_symbolic_aux:w
29880 #1 \s\_fp_symbolic #2 \s\_fp_mark #3#4 \s\_fp_stop { #3 }

```

(End of definition for `_fp_if_has_symbolic:nTF` and `_fp_if_has_symbolic_aux:w`.)

`_fp_exp_after_symbolic_f:nw` This function does two things: trigger an f-expansion of the argument #1 after the following symbolic expression, and evaluate all pieces of the expression which can be evaluated.

`_fp_exp_after_symbolic_aux:w`
`_fp_exp_after_symbolic_loop:N`

```

29881 \cs_new:Npn \_fp_exp_after_symbolic_f:nw
29882 #1 \s\_fp_symbolic \_fp_symbolic_chk:w #2, #3#4\_fp_sep:

```

(End of definition for __fp_symbolic_to_tl:w and others.)

84.7 Identifiers

Functions defined here are not necessarily tied to symbolic expressions.

__fp_id_if_invalid:nTF If #1 contains a space, it is not a valid identifier. Otherwise, loop through letters in #1: if it is not a letter, break the loop and return true. If the end of the loop is reached without finding any non-letter, return false. Note #1 must be a str (i.e., resulted from \tl_to_str:n).

```

30021 \prg_new_protected_conditional:Npnn
30022   \__fp_id_if_invalid:n #1 { T , F , TF }
30023 {
30024   \tl_if_empty:nTF {#1}

```

```

30025     { \prg_return_true: }
30026   {
30027     \tl_if_in:nnTF { #1 } { ~ }
30028     { \prg_return_true: }
30029     {
30030       \__fp_id_if_invalid_aux:N #1
30031       { ? \prg_break:n \prg_return_false: }
30032       \prg_break_point:
30033     }
30034   }
30035 }
30036 \cs_new:Npn \__fp_id_if_invalid_aux:N #1
30037 {
30038   \use_none:n #1
30039   \int_compare:nF { 'a <= '#1 <= 'z }
30040   {
30041     \int_compare:nF { 'A <= '#1 <= 'Z }
30042     { \prg_break:n \prg_return_true: }
30043   }
30044   \__fp_id_if_invalid_aux:N
30045 }

```

(End of definition for __fp_id_if_invalid:nTF and __fp_id_if_invalid_aux:N.)

84.8 Declaring variables and assigning values

__fp_variable_o:w We do not use \exp_last_unbraced:Nv to extract the value of \l__fp_variable_#1_fp because in \fp_set_variable:nn we define this fp variable to be something which f-expands to an actual floating point, rather than a genuine floating point.

```

30046 \cs_new:Npn \__fp_variable_o:w #1 @ #2
30047 {
30048   \fp_if_exist:cTF { l__fp_variable_#1_fp }

30130     }
30131     \__fp_variable_set_parsing:Nn \cs_gset_eq:NN {#1}
30132   }
30133 }
```

(End of definition for `\fp_new_variable:n` and `__fp_new_variable:n`. This function is documented on page 273.)

`\l__fp_symbolic_flag` Refuse invalid identifiers. If the variable does not exist yet, raise an error and define it just as in `\fp_set_variable:nn` (but without unnecessary checks). Then evaluate #2. If `\fp_set_variable:nn` the result contains the identifier #1, we would later get a loop in cases such as

```

\fp_set_variable:nn {A} {A}
\fp_show:n {A}
```

To detect this, define `\l__fp_variable_#1_fp` to raise an internal flag and evaluate to `nan`. Then re-evaluate `\l__fp_symbolic_fp`, and store the result in #1. If the flag is raised, #1 was present in `\l__fp_symbolic_fp`. In all cases, the #1-free result ends up in `\l__fp_variable_#1_fp`.

```

30134 \flag_new:N \l__fp_symbolic_flag
30135 \cs_new_protected:Npn \fp_set_variable:nn #1

Chapter 86

l3fparray implementation

```
30357 <*code>
30358 <@@=fp>
```

In analogy to l3intarray it would make sense to have <@@=fparray>, but we need direct access to `__fp_parse:n` from l3fp-parse, and a few other (less crucial) internals of the l3fp family.

86.1 Allocating arrays

There are somewhat more than $(2^{31} - 1)^2$ floating point numbers so we store each floating point number as three entries in integer arrays. To avoid having to multiply indices by three or to add 1 etc, a floating point array is just a token list consisting of three tokens: integer arrays of the same size.

```
\g__fp_array_int Used to generate unique names for the three integer arrays.
30359 \int_new:N \g__fp_array_int
(End of definition for \g__fp_array_int.)

\l__fp_array_loop_int Used to loop in \__fp_array_gzero:N.
30360 \int_new:N \l__fp_array_loop_int
(End of definition for \l__fp_array_loop_int.)

\fparray_new:Nn Build a three-token token list, then define all three tokens to be integer arrays of the
\fparray_new:cn same size. No need to initialize the data: the integer arrays start with zeros, and three
\__fp_array_new:nNNN zeros denote precisely \c_zero_fp, as we want.
30361 \cs_new_protected:Npn \fparray_new:Nn #1#2
30362 {
30363   \tl_new:N #1
30364   \prg_replicate:nn { 3 }

30386   }
30387 }

```

(End of definition for `\fparray_new:Nn` and `__fp_array_new:nNNNN`. This function is documented on page 289.)

`\fparray_count:N` Size of any of the intarrays, here we pick the third.

```

\fparray_count:c
30388 \cs_new:Npn \fparray_count:N #1
30389 {
30390   \exp_after:wN \use_i:nnn
30391   \exp_after:wN \intarray_count:N #1
30392 }
30393 \cs_generate_variant:Nn \fparray_count:N { c }

```

(End of definition for `\fparray_count:N`. This function is documented on page 290.)

86.2 Array items

`__fp_array_bounds:NNnTF` See the `\intarray` analogue: only names change. The functions `\fparray_gset:Nnn` and `__fp_array_bounds_error:NNn` `\fparray_item:Nn` share bounds checking. The T branch is used if #3 is within bounds of the array #2.

```

30394 \cs_new:Npn \__fp_array_bounds:NNnTF #1#2#3#4#5
30395 {
30396   \if_int_compare:w 1 > #3 \exp_stop_f:

Chapter 88

l3cctab implementation

```
30748 <*code>
30749 <@@=cctab>
```

As LuaTeX offers engine support for category code tables, and this is entirely lacking from the other engines, we need two complementary approaches. (Some future XeTeX may add support, at which point the conditionals below would be different.)

88.1 Variables

<pre>\g__cctab_stack_seq \g__cctab_unused_seq</pre>	<p>List of catcode tables saved by nested <code>\cctab_begin:N</code>, to restore catcodes at the matching <code>\cctab_end:.</code> When popped from the <code>\g__cctab_stack_seq</code> the table numbers are stored in <code>\g__cctab_unused_seq</code> for later reuse.</p> <pre>30750 \seq_new:N \g__cctab_stack_seq 30751 \seq_new:N \g__cctab_unused_seq</pre> <p><i>(End of definition for \g__cctab_stack_seq and \g__cctab_unused_seq.)</i></p>
<pre>\g__cctab_group_seq</pre>	<p>A stack to store the group level when a catcode table started.</p> <pre>30752 \seq_new:N \g__cctab_group_seq</pre> <p><i>(End of definition for \g__cctab_group_seq.)</i></p>
<pre>\g__cctab_allocate_int</pre>	<p>Integer to keep track of what category code table to allocate. In LuaTeX it is only used in format mode to implement <code>\cctab_new:N</code>. In other engines it is used to make csnames for dynamic tables.</p> <pre>30753 \int_new:N \g__cctab_allocate_int</pre> <p><i>(End of definition for \g__cctab_allocate_int.)</i></p>
<pre>\l__cctab_internal_a_tl \l__cctab_internal_b_tl</pre>	<p>Scratch space. For instance, when popping <code>\g__cctab_stack_seq/\g__cctab_unused_seq</code>, consists of the catcodetable number (integer denotation) in LuaTeX, or of an intarray variable (as a single token) in other engines.</p> <pre>30754 \tl_new:N \l__cctab_internal_a_tl 30755 \tl_new:N \l__cctab_internal_b_tl</pre> <p><i>(End of definition for \l__cctab_internal_a_tl and \l__cctab_internal_b_tl.)</i></p>

`\g__cctab_endlinechar_prop` In LuaTeX we store the `\endlinechar` associated to each `\catcodetable` in a property list, unless it is the default value 13.

```
30756 \prop_new:N \g__cctab_endlinechar_prop
```

(End of definition for `\g__cctab_endlinechar_prop`.)

88.2 Allocating category code tables

`\cctab_new:N` The `__cctab_new:N` auxiliary allocates a new catcode table but does not attempt to set its value consistently across engines. It is used both in `\cctab_new:N`, which sets catcodes to `iniTeX` values, and in `\cctab_begin:N/\cctab_end:` for dynamically allocated tables.

`__cctab_new:N` First, the LuaTeX case. Creating a new category code table is done like other registers. In ConTeXt, `\newcatcodetable` does not include the initialisation, so that is added explicitly.

`__cctab_gstore:Nnn`

```
30757 \sys_if_engine luatex:TF
30758 {
30759   \cs_new_protected:Npn \cctab_new:N #1
30760   {
30761     \__kernel_chk_if_free_cs:N #1
30762     \__cctab_new:N #1
30763   }
30764   \cs_new_protected:Npn \__cctab_new:N #1
30765   {
30766     \newcatcodetable #1
30767     \tex_initcatcodetable:D #1
30768   }
30769 }
```

Now the case for other engines. Here, each table is an integer array. Following the LuaTeX pattern, a new table starts with `iniTeX` codes. The `\debug_suspend:` and `\debug_resume:` functions prevent errors and logging from `debug` commands which are either duplicate or false when `__cctab_new:N` is used by `\cctab_new:N` or `\cctab_const:Nn`. The index base is out-by-one, so we have an internal function to handle that. The `iniTeX` `\endlinechar` is 13.

```
30770 {
30771   \cs_new_protected:Npn \__cctab_new:N #1
30772   {
30773     \debug_suspend:
30774     \intarray_new:Nn #1 { 257 }
30775     \debug_resume:
30776   }
30777   \cs_new_protected:Npn \__cctab_gstore:Nnn #1#2#3
30778   { \intarray_gset:Nnn #1 { #2 + 1 } {#3} }
30779   \cs_new_protected:Npn \cctab_new:N #1
30780   {
30781     \__kernel_chk_if_free_cs:N #1
30782     \__cctab_new:N #1
30783     \int_step_inline:nn { 256 }
30784     { \__kernel_intarray_gset:Nnn #1 {##1} { 12 } }
30785     \__kernel_intarray_gset:Nnn #1 { 257 } { 13 }
30786     \__cctab_gstore:Nnn #1 { 0 } { 9 }
30787     \__cctab_gstore:Nnn #1 { 13 } { 5 }
```

```

30788     \__cctab_gstore:Nnn #1 { 32 } { 10 }
30789     \__cctab_gstore:Nnn #1 { 37 } { 14 }
30790     \int_step_inline:nnn { 65 } { 90 }
30791     { \__cctab_gstore:Nnn #1 {##1} { 11 } }
30792     \__cctab_gstore:Nnn #1 { 92 } { 0 }
30793     \int_step_inline:nnn { 97 } { 122 }
30794     { \__cctab_gstore:Nnn #1 {##1} { 11 } }
30795     \__cctab_gstore:Nnn #1 { 127 } { 15 }
30796   }
30797 }
30798 \cs_generate_variant:Nn \cctab_new:N { c }

```

(End of definition for `\cctab_new:N`, `__cctab_new:N`, and `__cctab_gstore:Nnn`. This function is documented on page 295.)

88.3 Saving category code tables

```

\__cctab_gset:n
\__cctab_gset_aux:n

```

In various functions we need to save the current catcodes (globally) in a table. In LuaTeX, saving the catcodes is a primitives, but the `\endlinechar` needs more work: to avoid filling `\g__cctab_endlinechar_prop` with many entries we special-case the default value 13. In other engines we store 256 current catcodes and the `\endlinechar` in an intarray variable.

```

30799 \sys_if_engine luatex:TF
30800 {
30801   \cs_new_protected:Npn \__cctab_gset:n #1
30802   { \exp_args:Nf \__cctab_gset_aux:n { \int_eval:n {#1} } }
30803   \cs_new_protected:Npn \__cctab_gset_aux:n #1
30804   {
30805     \tex_savecatcodetable:D #1 \scan_stop:
30806     \int_compare:nNnTF { \tex_endlinechar:D } = { 13 }
30807     { \prop_gremove:Nn \g__cctab_endlinechar_prop {#1} }
30808     {
30809       \prop_gput:NnV \g__cctab_endlinechar_prop {#1}
30810       \tex_endlinechar:D
30811     }
30812   }
30813 }
30814 {
30815   \cs_new_protected:Npn \__cctab_gset:n #1
30816   {
30817     \int_step_inline:nn { 256 }
30818     {
30819       \__kernel_intarray_gset:Nnn #1 {##1}
30820       { \char_value_catcode:n { ##1 - 1 } }
30821     }
30822     \__kernel_intarray_gset:Nnn #1 { 257 }
30823     { \tex_endlinechar:D }
30824   }
30825 }

```

(End of definition for `__cctab_gset:n` and `__cctab_gset_aux:n`.)

`\cctab_gset:Nn` Category code tables are always global, so only one version of assignments is needed.
`\cctab_gset:cn` Simply run the setup in a group and save the result in a category code table #1, provided it is valid. The internal function is defined above depending on the engine.

```

30826 \cs_new_protected:Npn \cctab_gset:Nn #1#2
30827 {
30828   \__cctab_chk_if_valid:NT #1
30829   {
30830     \group_begin:
30831       \cctab_select:N \c_initex_cctab
30832       #2 \scan_stop:
30833       \__cctab_gset:n {#1}
30834     \group_end:
30835   }
30836 }
30837 \cs_generate_variant:Nn \cctab_gset:Nn { c }

```

(End of definition for `\cctab_gset:Nn`. This function is documented on page 295.)

`\cctab_gsave_current:N` Very simple.

```

\cctab_gsave_current:c
30838 \cs_new_protected:Npn \cctab_gsave_current:N #1
30839 {
30840   \__cctab_chk_if_valid:NT #1
30841   { \__cctab_gset:n {#1} }
30842 }
30843 \cs_generate_variant:Nn \cctab_gsave_current:N { c }

```

(End of definition for `\cctab_gsave_current:N`. This function is documented on page 295.)

88.4 Using category code tables

`\g__cctab_internal_cctab` In LuaTeX, we must ensure that the saved tables are read-only. This is done by applying
`__cctab_internal_cctab_name:` the saved table, then switching immediately to a scratch table. Any later catcode assignment will affect that scratch table rather than the saved one. If we simply switched to the saved tables, then `\char_set_catcode_other:N` in the example below would change `\c_document_cctab` and a later use of that table would give the wrong category code to `_`.

```

\use:n
{
  \cctab_begin:N \c_document_cctab
  \char_set_catcode_other:N \_
  \cctab_end:
  \cctab_begin:N \c_document_cctab
  \int_compare:nTF { \char_value_catcode:n { '_' } = 8 }
  { \TRUE } { \ERROR }
  \cctab_end:
}

```

We must also make sure that a scratch table is never reused in a nested group: in the following example, the scratch table used by the first `\cctab_begin:N` would be changed globally by the second one issuing `\savecatcodetable`, and after `\group_end:` the wrong

category codes (those of `\c_str_cctab`) would be imposed. Note that the inner `\cctab_end` restores the correct catcodes only locally, so the problem really comes up because of the different grouping level. The simplest is to use a scratch table labeled by the `\currentgrouplevel`. We initialize one of them as an example.

```
\use:n
{
  \cctab_begin:N \c_document_cctab
  \group_begin:
    \cctab_begin:N \c_str_cctab
    \cctab_end:
  \group_end:
  \cctab_end:
}

30844 \sys_if_engine luatex:T
30845 {
30846   \__cctab_new:N \g__cctab_internal_cctab
30847   \cs_new:Npn \__cctab_internal_cctab_name:
30848     {
30849       g__cctab_internal
30850       \tex_romannumeral:D \tex_currentgrouplevel:D
30851       _cctab
30852     }
30853 }
```

(End of definition for `\g__cctab_internal_cctab` and `__cctab_internal_cctab_name:`.)

`\cctab_select:N` The public function simply checks the `\cctab var` exists before using the engine-dependent `__cctab_select:N`. Skipping these checks would result in low-level engine-dependent errors. First, the LuaTeX case. In other engines, selecting a catcode table is a matter of doing 256 catcode assignments and setting the `\endlinechar`.

```
30854 \cs_new_protected:Npn \cctab_select:N #1
30855   { \__cctab_chk_if_valid:NT #1 { \__cctab_select:N #1 } }
30856 \cs_generate_variant:Nn \cctab_select:N { c }
30857 \sys_if_engine luatex:TF
30858 {
30859   \cs_new_protected:Npn \__cctab_select:N #1
30860   {
30861     \tex_catcodetable:D #1
30862     \prop_get:NVNTF \g__cctab_endlinechar_prop #1 \l__cctab_internal_a_tl
30863     { \int_set:Nn \tex_endlinechar:D { \l__cctab_internal_a_tl } }
30864     { \int_set:Nn \tex_endlinechar:D { 13 } }
30865     \cs_if_exist:cF { \__cctab_internal_cctab_name: }
30866     { \exp_args:Nc \__cctab_new:N { \__cctab_internal_cctab_name: } }
30867     \exp_args:Nc \tex_savecatcodetable:D { \__cctab_internal_cctab_name: }
30868     \exp_args:Nc \tex_catcodetable:D { \__cctab_internal_cctab_name: }
30869   }
30870 }
30871 {
30872   \cs_new_protected:Npn \__cctab_select:N #1
30873   {
30874     \int_step_inline:nn { 256 }
30875     {
```

```

30876         \char_set_catcode:nn { ##1 - 1 }
30877         { \__kernel_intarray_item:Nn #1 {##1} }
30878     }
30879     \int_set:Nn \tex_endlinechar:D
30880     { \__kernel_intarray_item:Nn #1 { 257 } }
30881 }
30882 }

```

(End of definition for `\cctab_select:N` and `__cctab_select:N`. This function is documented on page 296.)

`\g__cctab_next_cctab` For `\cctab_begin:N/\cctab_end:` we will need to allocate dynamic tables. This is done here by `__cctab_begin_aux:`, which puts a table number (in LuaTeX) or name (in other engines) into `\l__cctab_internal_a_tl`. In LuaTeX this simply calls `__cctab_new:N` and uses the resulting catcodetable number; in other engines we need to give a name to the intarray variable and use that. In LuaTeX, to restore catcodes at `\cctab_end:` we cannot just set `\catcodetable` to its value before `\cctab_begin:N`, because that table may have been altered by other code in the mean time. So we must make sure to save the catcodes in a table we control and restore them at `\cctab_end:`.

```

30883 \sys_if_engine luatex:TF
30884 {
30885     \cs_new_protected:Npn \__cctab_begin_aux:
30886     {
30887         \__cctab_new:N \g__cctab_next_cctab
30888         \tl_set:NW \l__cctab_internal_a_tl \g__cctab_next_cctab
30889         \cs_undefine:N \g__cctab_next_cctab
30890     }
30891 }
30892 {
30893     \cs_new_protected:Npn \__cctab_begin_aux:
30894     {
30895         \int_gincr:N \g__cctab_allocate_int
30896         \exp_args:Nc \__cctab_new:N
30897         { g__cctab_ \int_use:N \g__cctab_allocate_int _cctab }
30898         \exp_args:NNc \tl_set:Nn \l__cctab_internal_a_tl
30899         { g__cctab_ \int_use:N \g__cctab_allocate_int _cctab }
30900     }
30901 }

```

(End of definition for `\g__cctab_next_cctab` and `__cctab_begin_aux:`.)

`\cctab_begin:N` Check the `<cctab var>` exists, to avoid low-level errors. Get in `\l__cctab_internal_a_tl` the number/name of a dynamic table, either from `\g__cctab_unused_seq` where we save tables that are not currently in use, or from `__cctab_begin_aux:` if none are available. Then save the current catcodes into the table (pointed to by) `\l__cctab_internal_a_tl` and save that table number in a stack before selecting the desired catcodes.

```

30902 \cs_new_protected:Npn \cctab_begin:N #1
30903 {
30904     \__cctab_chk_if_valid:NT #1
30905     {
30906         \seq_gpop:NMF \g__cctab_unused_seq \l__cctab_internal_a_tl
30907         { \__cctab_begin_aux: }
30908         \__cctab_chk_group_begin:e

```

```

30909         { \__cctab_nesting_number:N \l__cctab_internal_a_tl }
30910         \seq_gpush:NV \g__cctab_stack_seq \l__cctab_internal_a_tl
30911         \exp_args:NV \__cctab_gset:n \l__cctab_internal_a_tl
30912         \__cctab_select:N #1
30913     }
30914 }
30915 \cs_generate_variant:Nn \cctab_begin:N { c }

```

(End of definition for `\cctab_begin:N`. This function is documented on page 296.)

`\cctab_end:` Make sure a `\cctab_begin:N` was used some time earlier, get in `\l__cctab_internal_a_tl` the catcode table number/name in which the prevailing catcodes were stored, then restore these catcodes. The dynamic table is now unused hence stored in `\g__cctab_unused_seq` for recycling by later `\cctab_begin:N`.

```

30916 \cs_new_protected:Npn \cctab_end:
30917 {
30918     \seq_gpop:NNTF \g__cctab_stack_seq \l__cctab_internal_a_tl
30919     {
30920         \seq_gpush:NV \g__cctab_unused_seq \l__cctab_internal_a_tl
30921         \exp_args:Ne \__cctab_chk_group_end:n
30922         { \__cctab_nesting_number:N \l__cctab_internal_a_tl }
30923         \__cctab_select:N \l__cctab_internal_a_tl
30924     }
30925     { \msg_error:nn { cctab } { extra-end } }
30926 }

```

(End of definition for `\cctab_end:`. This function is documented on page 296.)

`__cctab_chk_group_begin:n` Catcode tables are not allowed to be intermixed with groups, so here we check that they are properly nested regarding TeX groups. `__cctab_chk_group_begin:n` stores the current group level in a stack, and locally defines a dummy control sequence `__cctab_group_⟨cctab-level⟩_chk:`.

`__cctab_chk_group_end:n` pops the stack, and compares the returned value with `\tex_currentgrouplevel:D`. If they differ, `\cctab_end:` is in a different grouping level than the matching `\cctab_begin:N`. If they are the same, both happened at the same level, however a group might have ended and another started between `\cctab_begin:N` and `\cctab_end:`:

```

\group_begin:
  \cctab_begin:N \c_document_cctab
\group_end:
\group_begin:
  \cctab_end:
\group_end:

```

In this case checking `\tex_currentgrouplevel:D` is not enough, so we locally define `__cctab_group_⟨cctab-level⟩_chk:`, and then check if it exist in `\cctab_end:`. If it doesn't, we know there was a group end where it shouldn't.

The `⟨cctab-level⟩` in the sentinel macro above cannot be replaced by the more convenient `\tex_currentgrouplevel:D` because with the latter we might be tricked. Suppose:

```

\group_begin:
  \cctab_begin:N \c_code_cctab % A
\group_end:
\group_begin:
  \cctab_begin:N \c_code_cctab % B
  \cctab_end: % C
  \cctab_end: % D
\group_end:

```

The line marked with A would start a `cctab` with a sentinel token named `__cctab_group_1_chk:`, which would disappear at the `\group_end:` that follows. But B would create the same sentinel token, since both are at the same group level. Line C would end the `cctab` from line B correctly, but so would line D because line B created the same sentinel token. Using `\cctab_level` works correctly because it signals that certain `cctab` level was activated somewhere, but if it doesn't exist when the `\cctab_end:` is reached, we had a problem.

Unfortunately these tests only flag the wrong usage at the `\cctab_end:`, which might be far from the `\cctab_begin:N`. However it isn't possible to signal the wrong usage at the `\group_end:` without using `\tex_aftergroup:D`, which is unsafe in certain types of groups.

The three cases checked here just raise an error, and no recovery is attempted: usually interleaving groups and catcode tables will work predictably.

```

30927 \cs_new_protected:Npn \__cctab_chk_group_begin:n #1
30928 {
30929   \seq_gpush:N \g__cctab_group_seq
30930   { \int_use:N \tex_currentgrouplevel:D }
30931   \cs_set_eq:cN { __cctab_group_ #1 _chk: } \prg_do_nothing:
30932 }
30933 \cs_generate_variant:Nn \__cctab_chk_group_begin:n { e }
30934 \cs_new_protected:Npn \__cctab_chk_group_end:n #1
30935 {

30937   \bool_lazy_and:nnF
30938   {
30939     \int_compare_p:nNn
30940     { \tex_currentgrouplevel:D } = { \l__cctab_internal_b_tl }
30941   }
30942   { \cs_if_exist_p:c { __cctab_group_ #1 _chk: } }
30943   {
30944     \msg_error:nne { cctab } { group-mismatch }
30945     {
30946       \int_sign:n
30947       { \tex_currentgrouplevel:D - \l__cctab_internal_b_tl }
30948     }
30949   }
30950   \cs_undefine:c { __cctab_group_ #1 _chk: }
30951 }

```

(End of definition for `__cctab_chk_group_begin:n` and `__cctab_chk_group_end:n`.)

`__cctab_nesting_number:N` This macro returns the numeric index of the current catcode table. In LuaTeX this is just the argument, which is a count reference to a `\catcodetable` register. In other engines, the number is extracted from the `cctab` variable.

```

30952 \sys_if_engine luatex:TF
30953 { \cs_new:Npn \__cctab_nesting_number:N #1 {#1} }
30954 {
30955   \cs_new:Npn \__cctab_nesting_number:N #1
30956   {
30957     \exp_after:wN \exp_after:wN \exp_after:wN \__cctab_nesting_number:w
30958     \exp_after:wN \token_to_str:N #1
30959   }
30960   \use:e
30961   {
30962     \cs_new:Npn \exp_not:N \__cctab_nesting_number:w
30963     #1 \tl_to_str:n { g__cctab_ } #2 \tl_to_str:n { _cctab } {#2}
30964   }
30965 }

```

(End of definition for `__cctab_nesting_number:N` and `__cctab_nesting_number:w`.)

Finally, install some code at the end of the \TeX run to check that all `\cctab_begin:N` were ended by some `\cctab_end:.`

```

30966 \cs_if_exist:NT \hook_gput_code:nnn
30967 {
30968   \hook_gput_code:nnn { enddocument/end } { cctab }
30969   {
30970     \seq_if_empty:NF \g__cctab_stack_seq
30971     { \msg_error:nn { cctab } { missing-end } }
30972   }
30973 }

```

`\cctab_item:Nn` Evaluate the integer argument only once. In most engines the `cctab` variable only has 256 entries so we only look up the catcode for these entries, otherwise we use the current catcode. In particular, for out-of-range values we use whatever fall-back `\char_value_catcode:n`. In Lua \TeX , we use the `tex.getcatcode` function.

`\cctab_item:cn`

```

30974 \cs_new:Npn \cctab_item:Nn #1#2
30975 { \exp_args:Nf \__cctab_item:nN { \int_eval:n {#2} } #1 }
30976 \sys_if_engine luatex:TF
30977 {
30978   \cs_new:Npn \__cctab_item:nN #1#2
30979   { \lua_now:e { tex.print(-2, tex.getcatcode(\int_use:N #2, #1)) } }
30980 }
30981 {
30982   \cs_new:Npn \__cctab_item:nN #1#2
30983   {

88.5 Category code table conditionals

`\cctab_if_exist_p:N` Checks whether a $\langle cctab\ var \rangle$ is defined.

`\cctab_if_exist_p:c`

`\cctab_if_exist:NTF`

`\cctab_if_exist:cTF`

```

30990 \prg_new_eq_conditional:NNn \cctab_if_exist:N \cs_if_exist:N
30991 { TF , T , F , p }
30992 \prg_new_eq_conditional:NNn \cctab_if_exist:c \cs_if_exist:c
30993 { TF , T , F , p }

```

(End of definition for \cctab_if_exist:NTF. This function is documented on page 296.)

```

\__cctab_chk_if_valid:NTF
\__cctab_chk_if_valid_aux:NTF

```

Checks whether the argument is defined and whether it is a valid `<cctab var>`. In LuaTeX the validity of the `<cctab var>` is checked by the engine, which complains if the argument is not a `\chardef`'ed constant. In other engines, check if the given command is an intarray variable (the underlying definition is a copy of the cmr10 font).

```

88.6 Constant category code tables

`\cctab_const:Nn` Creates a new `\cctab var` then sets it with the `iniTeX` and user-supplied codes. To avoid false debug errors, we write out implementation of `\cctab_new:N` and `\cctab_gset:Nn` instead of directly using them here. The initialization part in `\cctab_new:N` in non-`LuaTeX` is omitted as it's covered by the `iniTeX` settings.

```

31035 \cs_new_protected:Npn \cctab_const:Nn #1#2
31036 {
31037   \__kernel_chk_if_free_cs:N #1
31038   \__cctab_new:N #1
31039   \group_begin:
31040     \cctab_select:N \c_initex_cctab
31041     #2 \scan_stop:
31042     \__cctab_gset:n {#1}
31043   \group_end:
31044 }
31045 \cs_generate_variant:Nn \cctab_const:Nn { c }

```

(End of definition for `\cctab_const:Nn`. This function is documented on page 295.)

`\c_initex_cctab` Creating category code tables means thinking starting from `iniTeX`. For all-other and
`\c_other_cctab` the standard “string” tables that’s easy.
`\c_str_cctab`

```

31046 \cctab_new:N \c_initex_cctab
31047 \cctab_const:Nn \c_other_cctab
31048 {
31049   \cctab_select:N \c_initex_cctab
31050   \int_set:Nn \tex_endlinechar:D { -1 }
31051   \int_step_inline:nnn { 0 } { 127 }
31052     { \char_set_catcode_other:n {#1} }
31053 }
31054 \cctab_const:Nn \c_str_cctab
31055 {
31056   \cctab_select:N \c_other_cctab
31057   \char_set_catcode_space:n { 32 }
31058 }

```

(End of definition for `\c_initex_cctab`, `\c_other_cctab`, and `\c_str_cctab`. These variables are documented on page 297.)

`\c_code_cctab` To pick up document-level category codes, we need to delay set up to the end of the
`\c_document_cctab` format, where that’s possible. Also, as there are a *lot* of category codes to set, we avoid using the official interface and store the document codes using internal code. Depending on whether we are in the hook or not, the catcodes may be code or document, so we explicitly set up both correctly.

```

Unicode implementation

```
31153 <*code>
31154 <@@=codepoint>
```

89.1 User functions

```
\codepoint_str_generate:n
  \_codepoint_str_generate:nnnn
\codepoint_generate:nn
\_codepoint_generate:nnnn
  \_codepoint_generate:n
```

Conversion of a codepoint to a character (Unicode engines) or to one or more bytes (8-bit engines) is required. For loading the data, all that is needed is the form which creates strings: these are outside the group as they will also be used when looking up data in the hash table storage at point-of-use. Later, we will also need functions that can generate character tokens for document use: those are defined below, in the data recovery setup.

```
31155 \sys_if_engine_opentype:TF

89.2 Data loader

Text operations requires data from the Unicode Consortium. Data read into Unicode engine formats is at best a small part of what we need, so there is a loader here to set up the appropriate data structures.

Where we need data for most or all of the Unicode range, we use the two-stage table approach recommended by the Unicode Consortium and demonstrated in a model implementation in Python in https://www.strchr.com/multi-stage_tables. This approach uses the `intarray` (fontdimen-based) data type as it is fast for random access and avoids significant hash table usage. In contrast, where only a small subset of codepoints are required, storage as macros is preferable. There is also some consideration of the effort needed to load data: see for example the grapheme breaking information, which would be problematic to convert into a two-stage table but which can be used with reasonable performance in a small number of comma lists (at the cost that breaking at higher codepoint Hangul characters will be slightly slow).

`\c_codepoint_block_size_int` Choosing the block size for the blocks in the two-stage approach is non-trivial: depending on the data stored, the optimal size for memory usage will vary. At the same time, for us there is also the question of load-time: larger blocks require longer comma lists as

intermediates, so are slower. As this is going to be needed to use the data, we set it up outside of the group for clarity.

```
31358 \int_const:Nn \c__codepoint_block_size_int { 64 }
```

(End of definition for \c__codepoint_block_size_int.)

Parsing the data files can be the same way for all engines, but where they are stored as character tokens, the construction method depends on whether they are Unicode or 8-bit internally. Parsing is therefore done by common functions, with some data storage using engine-specific auxiliaries.

As only the data needs to remain at the end of this process, everything is set up inside a group. The only thing that is outside is creating a stream: they are global anyway and it is best to force a stream for all engines.

```
\g__codepoint_data_ior
```

```
31359 \ior_new:N \g__codepoint_data_ior
```

(End of definition for \g__codepoint_data_ior.)

We need some setup for the two-part table approach. The number of blocks we need will be variable, but the resulting size of the stage one table is predictable. For performance reasons, we therefore create the stage one tables now so they can be used immediately, and will later rename them as a constant tables. For each two-stage table construction, we need a comma list to hold the partial block and a couple of integers to track where we are up to. To avoid burning registers, the latter are stored in macros and are “fake” integers. We also avoid any **new** functions, keeping as much as possible local.

As we need both positive and negative values, case data requires one two-stage table for each transformation. In contrasts, general Unicode properties could be stored in one table with appropriate combination rules: that is not done at present but is likely to be added over time. Here, all that is needed is additional entries into the comma-list to create the structures.

Notice that in the standard `expl3` way we are indexes position not offset: that does mean a little work later.

For integer values, everything is done using token lists to avoid loosing registers or making global names.

```
31360 \group_begin:
31361 \clist_map_inline:nn
31362 { category , grapheme , lowercase , uppercase , wordbreak }
31363 {
31364   \cs_set_nopar:cpn { l__codepoint_ #1 _block_clist } { }
31365   \cs_set_nopar:cpn { l__codepoint_ #1 _block_tl } { 1 }
31366   \cs_set_nopar:cpn { l__codepoint_ #1 _pos_tl } { 0 }
31367   \cs_set_nopar:cpn { l__codepoint_ #1 _next_tl } { 0 }
31368   \intarray_new:cn { g__codepoint_ #1 _index_intarray }
31369   { \int_div_truncate:nn { "110000 } \c__codepoint_block_size_int }
31370 }
```

We also need to track the matched block: this is used dynamically so we only require one variable.

```
31371 \cs_set_nopar:Npn \l__codepoint_matched_block_tl { 0 }
```

For Unicode general category and the various breaking properties, there needs to be numerical representation of each possible value. As we need to go from string to number here, but the other way elsewhere, we set up fast mappings both ways, but one set local and the other as constants.

For the the property fields, we need to use a two-step procedure as the file is ordered by class not codepoint. First, we parse the content into the hash table locally: there are around 1400 codepoints to handle, which is workable. Reading this is quite easy: we store any end-of-range codepoint and the class that applies. Conversion to a two-stage table is deferred to later.

```

31418 \cs_set_protected:Npn \__codepoint_data_auxi:w #1 ; ~ #2 ~ #3 \q_stop

31459   }
31460 }

```

Parse the main Unicode data file and pull out the NFD and case changing data. The NFD data is stored on using the hash table approach and can yield a predictable number of codepoints: one or two. We also need the case data, which will be modified further below. To allow for finding ranges, the description of the codepoint needs to be carried forward.

```

31461 \cs_set_protected:Npn \__codepoint_data_auxi:w
31462 #1 ; #2 ; #3 ; #4 ; #5 ; #6 ; #7 ; #8 ; #9 ;
31463 {

31474     { c__codepoint_nfd_ \codepoint_str_generate:n {"#1} _tl }
31475     {
31476         {"#2}
31477         { \tl_if_blank:nF {"#3} {"#3} }
31478     }
31479 }

```

The category data needs to be converted from a string to the numerical equivalent: a simple operation. The case data is going to be stored as an offset from the parent character, rather than an absolute value. We therefore deal with that plus the situation where a codepoint has no mapping data in one shot.

```

31480 \cs_set_protected:Npn \__codepoint_data_auxiii:w
31481     #1 ; #2 ; #3 ; #4 ; #5 ; #6 ; #7 ; #8 ; #9 ~ \q_stop

31498     { 0 }
31499     { \int_eval:n { "#2 - "#1 } }
31500 }

```

To deal with ranges, we track the position of the next codepoint expected. If there is a gap, we deal with that separately: it could be a range or an unused part of the Unicode space. As such, we deal with the current codepoint here whether or not there is range to fill in. Upper- and lowercase data go into the two-stage table, any titlecase exception is just stored in a macro. The data for the codepoint is added to the current block, and if that is now complete we move on to save the block. The case exceptions are all stored as codepoints, with a fixed number of balanced text as we know that there are never more than three.

```

31501 \cs_set_protected:Npn \__codepoint_data_auxiv:w #1 ; #2 ; #3 ; #4 ; #5 ; #6 ;
31502 {

31517     \__codepoint_data_auxvi:nn { grapheme } {"#1}
31518     \__codepoint_data_auxvi:nn { wordbreak } {"#1}

```

To deal with the property data, we need to recover stored information and build the table. Generally we can assume that all codepoints in these files are in `UnicodeData.txt`, but there is one place a bit more work is needed. For Hangul syllables, the main file lists a range but within that we have different classifications for breaking: that needs to be handled with a second loop. The values for this range are hard-coded, skipping the end-of-range as that will be mopped up by the main loop.

```

31519     \int_compare:nNnT {"#1} = { "AC00 }
31520     {
31521         \int_step_inline:nnn { "AC01 } { "D7A2 }

31604 }

```

To allow rapid comparison, each completed block is stored locally as a comma list: once all of the blocks have been created, they are converted into an `intarray` in one step. The aim here is to check the current block against those we've already used, and either match to an existing block or save a new block.

```

31605 \cs_set_protected:Npn \__codepoint_save_blocks:nn #1#2
31606 {
31607     \tl_set_eq:Nc \l__codepoint_matched_block_tl { l__codepoint_ #1 _block_tl }

```

(End of definition for `__kernel_codepoint_data:nn` and `__codepoint_data:nnn`.)

The other data files all use C-style comments so we have to worry about `#` tokens (and reading as strings). The set up for case folding is in two parts. For the basic (core) mappings, folding is the same as lower casing in most positions so only store the differences. For the more complex foldings, always store the result, splitting up the two or three code points in the input as required.

```
31718 \group_begin:
31719 \ior_open:Nn \g__codepoint_data_ior { CaseFolding.txt }

```

For character tokens, we need to filter out the implicit characters from those that are explicit. That's done here, then if necessary we work out the category code and generate the char. To avoid issues with alignment tabs, that one is done by elimination rather than looking up the code explicitly. The trick with finding the charcode is that the $\text{T}_{\text{E}}\text{X}$ messages are either the *something* character `\char` or the *type* `\char`.

```

32163 \tex_global:D \tex_chardef:D \c__text_chardef_group_end_token = '\} % '\{
32164 \tex_global:D \tex_mathchardef:D \c__text_mathchardef_group_end_token = '\} %

```

(End of definition for `\c__text_chardef_space_token` and others.)

`\text_expand:n`

After precautions against & tokens, start a simple loop: that of course means that “text” cannot contain the two recursion quarks. The loop here must be f-type expandable; we have arbitrary user commands which might be protected *and* take arguments, and if the expansion code is used in a typesetting context, that will otherwise explode. (The same issue applies more clearly to case changing: see the example there.) The outer loop has to use scan marks as delimiters to protect against unterminated `\romannumeral` usage in the input.

```

32217   \__text_expand_loop:w
32218 }

```

The first step in dealing with N-type tokens is to look for math mode material: that needs to be left alone. The starting function has to be split into two as we need `\quark_if_recursion_tail_stop:N` first before we can trigger the search. We then look for matching pairs of delimiters, allowing for the case where math mode starts but does not end. Within math mode, we simply pass all the tokens through unchanged, just checking the N-type ones against the end marker.

```

```

At this stage, either we have a control sequence or a simple character: split and handle. The need to check for non-protected actives arises from handling of legacy input encod-

ings: they need to end up in a representation we can deal with in further processing. The tests for explicit parts of the L^AT_EX 2_ε UTF-8 mechanism cover the case of book-marks, where definitions change and are no longer protected. The same is true for `babel` shorthands.

```

32274 \cs_new:Npn \__text_expand_explicit:N #1

LaTeX 2_ε's `\protect` makes life interesting. Where possible, we simply remove it and replace with the “parent” command; of course, the `\protect` might be explicit, in which case we need to leave it alone. That includes the case where it's not even followed by an N-type token. There is also the case of a straight `\@protected@testopt` to cover.

```

32453         { \token_if_active_p:N #1 }
32454     }
32455     {
32456         \exp_args:Nv \__text_expand_replace:n
32457         { l__text_expand_ \token_to_str:N #1 _tl }
32458     }
32459     { \__text_expand_cs_expand:N #1 }
32460 }
32461 \cs_new:Npn \__text_expand_replace:n #1 { \__text_expand_loop:w #1 }

```

Finally, expand any macros which can be: this then loops back around to deal with what they produce. The only issue is if the token is `\exp_not:n`, as that must apply to the following balanced text.

```

32462 \cs_new:Npn \__text_expand_cs_expand:N #1
32463 {
32464     \__text_if_expandable:NTF #1
32465     {
32466         \token_if_eq_meaning:NNTF #1 \exp_not:n
32467         { \__text_expand_unexpanded:w }

```

```

32468         { \exp_after:wN \__text_expand_loop:w #1 }
32469     }
32470     {
32471         \__text_expand_store:n {#1}
32472         \__text_expand_loop:w
32473     }
32474 }

```

Since `\exp_not:n` is actually a primitive, it allows a strange syntax and it particular the primitive expands what follows and discards spaces and `\scan_stop:` until finding a braced argument (the opening brace can be implicit but we will not support this here). Here, we repeatedly `f`-expand after such an `\exp_not:n`, and test what follows. If it is a brace group, then we found the intended argument of `\exp_not:n`. If it is a space, then the next `f`-expansion will eliminate it. If it is an N-type token then `__text_expand_unexpanded:N` leaves the token to be expanded if it is expandable, and otherwise removes it, assuming that it is `\scan_stop:`. This silently hides errors when `\exp_not:n` is incorrectly followed by some non-expandable token other than `\scan_stop:`, but this should be pretty rare, and there is no good error recovery anyways.

```

32545 \cs_new:Npn \text_titlecase_first:nn #1#2
32546 { \__text_change_case:nnnn { title } { break } {#1} {#2} }
32547 \cs_new:Npn \__text_change_case:nnnn #1#2#3
32548 { \__text_change_case:nnnn {#1} {#1} {#2} {#3} }
```

(End of definition for \text_lowercase:n and others. These functions are documented on page 303.)

`__text_change_case:nnnn` `__text_change_case_auxi:nnnn` `__text_change_case_auxii:nnnn` As for the expansion code, the business end of case changing is the handling of N-type tokens. First, we expand the input fully (so the loops here don't need to worry about awkward look-aheads and the like). Then we split into the different paths.

```
\__text_change_case_BCP:nnnn
\__text_change_case_BCP:nnnw
\__text_change_case_BCP:nnnnnw
\__text_change_case_store:n
\__text_change_case_store:o
\__text_change_case_store:V
\__text_change_case_store:v
\__text_change_case_store:e
\__text_change_case_store:nw
\__text_change_case_result:n
```

The code here needs to be f-type expandable to deal with the situation where case changing is applied in running text. There, we might have case changing as a document command and the text containing other non-expandable document commands.

```
\cs_set_eq:NN \MakeLowercase \text_lowercase
...
\MakeLowercase{\enquote*{A} text}
```

If we use an e-type expansion and wrap each token in `\exp_not:n`, that would explode: the document command grabs `\exp_not:n` as an argument, and things go badly wrong. So we have to wrap the entire result in exactly one `\exp_not:n`, or rather in the kernel version.

```

```

For a group, we *could* worry about whether this contains a character or not. However, that would make life very complex for little gain: exactly what a first character is is rather weakly-defined anyway. So if there is a group, we simply assume that a character has been seen, and for title case we switch to the “rest of the tokens” situation. To avoid having too much testing, we use a two-step process here to allow the titlecase functions to be separate.

```

The first step of handling N-type tokens is to filter out the end-of-loop. That has to be done separately from the first real step as otherwise we pick up the wrong delimiter. The loop here is the same as the `expand` one, just passing the additional data long. If no close-math token is found then the final clean-up is forced (i.e., there is no assumption of “well-behaved” input in terms of math mode).

Letter-like commands may still be present: they are set up using a simple lookup approach, so can easily be handled with no loop. If there is no hit, we are at the end of the process: we loop around. Letter-like chars are all available only in upper- and lowercase, so titlecasing maps to the uppercase version.

We need to ensure that only valid catcode-extraction is attempted. That's fine with

Unicode engines but needs a bit of work with 8-bit ones. The logic is that if the original codepoint was in the ASCII range, we keep the catcode. Otherwise, if the target is in the ASCII range, we use the standard catcode. If neither are true, we set as 13 on the grounds that this will be what is used anyway!

```

```

For Greek uppercasing, we need to know if characters *in the Greek range* have accents. That means doing a NFD conversion first, then starting a search. As described by the Unicode CLDR, Greek accents need to be found *after* any U+0308 (diaeresis) and are done in two groups to allow for the canonical ordering. The implementation here follows the data and examples from ICU (<https://icu.unicode.org/design/case/greek-upper>), although necessarily the implementation is somewhat different. The *ypogegrammeni* is filtered out here as it is not actually in the Greek range, so gets lost if we leave until later. The one Greek codepoint we skip is the numeral sign and question mark: the first has an awkward NFD for pdfTeX so is best left unchanged, and the latter has issues concerning how LGR outputs the input and output (differently!).

```

33154     { \_text_change_case_codepoint:nnnnn {#1} {#2} {#3} {#4} {#5} }
33155     }

```

```

33156     }
33157     \cs_new_eq:cn { __text_change_case_upper_el-x-iota:nnnnn }
33158     \__text_change_case_upper_el:nnnnn
33159     \cs_new:Npn \__text_change_case_upper_el:nnnn #1#2#3#4
33160     {
33161         \__text_codepoint_process:nN
33162         { \__text_change_case_upper_el:nnnnw {#2} {#3} {#4} } #1
33163     }

```

At this stage we have the first NFD codepoint as #3. What we need to know is whether after that we have another character, either from the NFD or directly in the input. If not, we store the changed character at this stage.

```

33164     \cs_new:Npn \__text_change_case_upper_el:nnnnw #1#2#3#4#5 \q__text_recursion_stop
33165     {
33166         \tl_if_head_is_N_type:nTF {#5}
33167         { \__text_change_case_upper_el:nnnnN {#4} }
33168         {
33169             \__text_change_case_store:e
33170             { \__text_change_case_codepoint:nn { upper } {#4} }
33171             \__text_change_case_loop:nnnw
33172         }
33173         {#1} {#2} {#3} #5 \q__text_recursion_stop
33174     }

```

Now, we check the detail of the next codepoint: again we filter out the not-a-char cases, before checking if it's an dialytika, accent or diacritic. (The latter do not have the same hiatus behavior as accents.) There is additional work if the codepoint can take a ypogegrammeni: there, we need to move any ypogegrammeni to after accents (in case the input is not normalised). The ypogegrammeni itself is handled separately.

\__text_change_case_breathing_aux:nnnnnw
\__text_change_case_breathing_aux:nnnnN
\__text_change_case_breathing_dialytika:nnnn

```

In Greek, breathing diacritics are normally dropped when uppercasing: see the code for the general case. However, for the first character of a word, if there is a breather *and* the next character takes a *dialytika*, it needs to be added. We start by checking if the current codepoint is in the Greek range, then decomposing.

```

33687 \cs_new:Npn \__text_change_case_breathing:nnnn #1#2#3#4
33688 {
33689   \__text_change_case_if_greek:nTF {#4}

33694       { \__text_codepoint_from_chars:Nw #4 }
33695     }
33696     {#1} {#2} {#3} {#4}
33697   }
33698   { \__text_change_case_loop:nnnw {#1} {#2} {#3} #4 }
33699 }
33700 \cs_new:Npn \__text_change_case_breathing:nnnnn #1#2#3#4#5
33701 {
33702   \__text_codepoint_process:nN
33703   { \__text_change_case_breathing:nnnnnw {#2} {#3} {#4} {#5} }
33704   #1 \q_mark
33705 }

```

Normal form decomposition will always give between one and three codepoints. Luckily, the two breathing marks (*psili* and *dasia*) will be in a predictable position: last. So we can quickly establish first that there was a change on decomposition, and second if the final resulting codepoint is one of the two we care about.

```

33706 \cs_new:Npn \__text_change_case_breathing:nnnnnw #1#2#3#4#5#6 \q_mark
33707 {
33708   \tl_if_blank:nTF {#6}

```

```

33709     { \_text_change_case_loop:nnnw {#1} {#2} {#3} #4 }
33710     {
33711         \_text_codepoint_process:nN

 __text_change_case_lower_tr:nnnNw
 __text_change_case_lower_tr:NnnnN
 __text_change_case_lower_tr:Nnnnn

The Turkic languages need special treatment for dotted-i and dotless-i. The lower casing rule can be expressed in terms of searching first for either a dotless-I or a dotted-I. In the latter case the mapping is easy, but in the former there is a second stage search.

```

34004 \cs_new:Npn \__text_change_case_lower_tr:nnnnn #1#2#3#4#5
34005 {
34006   \__text_codepoint_compare:nNnTF {#5} = { "0049 }
34007   { \__text_change_case_lower_tr:nnnNw {#1} {#3} {#4} #5 }
34008   {
34009     \__text_codepoint_compare:nNnTF {#5} = { "0130 }
34010     {
34011       \__text_change_case_store:e
34012       {
34013         \codepoint_generate:nn { "0069 }
34014         { \__text_change_case_catcode:nn {#5} { "0069 } }
34015       }
34016       \__text_change_case_loop:nnnw {#1} {#3} {#4}

34018     { \__text_change_case_codepoint:nnnnn {#1} {#2} {#3} {#4} {#5} }
34019   }
34020 }

```

After a dotless-I there may be a dot-above character. If there is then a dotted-i should be produced, otherwise output a dotless-i. When the combination is found both the dotless-I and the dot-above char have to be removed from the input.

```

```
34151 <*code>
34152 <@@=text>
```

92.1 Mapping to text

92.1.1 Common code

Mapping to text all works the same way: using standard “action” loop on expanded text. There are different ways to determine the boundary conditions for breaking: to avoid duplication, the common ideas are covered here with the specifics split out. In all cases, anything which is not a character token is treated as a boundary.

34244 }

```

There are various classes of character, and we deal with them all in the same general way. We need to example the relevant list of codepoints: if we get a hit, then we do whatever the relevant action is. To keep names short and to allow code sharing, we have two ways of naming the functions: most class names are unique, so it's only where we see the same name used in both break classes that we need more control.

```

34258 }

```

A generic loop-ahead setup: we need to handle both the previously collected tokens and any “conditional” ones. The latter occur when looking ahead for word-breaking: these *may* be combined with the collected tokens, but if we hit the end-of-loop, need to be output separately.

```

```

Hangul needs additional treatment. First we have to deal with the start-of-Hangul position: output what we had up to now, then move the specialist handler. The idea here is to pick off the different codepoint types one at a time, tracking what else can be considered at each stage until we hit the end of the viable types. Other than that, we just keep building up the Hangul codepoints using a dedicated version of the loop from above.

```

92.3 Word break mapping

`\text_map_function:nN`

The standard lead-off for an action loop.

```

\__text_map_collect:Nnnnnn 34466 \cs_new:Npn \text_words_map_function:nN #1#2
\__text_map_collect_auxi:nnnNnnnn 34467 {
\__text_map_collect_auxii:nNnnnnnn 34468     \__text_map_function:enN { \text_expand:n {#1} }
\__text_map_collect_auxiii:n 34469     { wordbreak } #2
\__text_map_collect_auxiv:nnNnnnnn 34470 }
\__text_map_collect_auxv:nNnnnnnn
\__text_map_collect_auxvi:Nnnnnnnn
\__text_map_ALetter:Nnnnn
\__text_map_Hebrew_Letter:Nnnn
\__text_map_Katakana:Nnnnn
\__text_map_Numeric:Nnnnn
\__text_map_WSegSpace:Nnnnn

```

The main rule for word breaking is that characters bind to following ones, potentially either allowing for *or* totally ignoring intervening ones. For each class, we are passed a list of classes that bind and ones that we should allow in between. In all cases, the classes **Extend**, **Format** and **ZWJ** need to be entirely ignored: they are hard coded and handled separately from the in-between ones. Notice that we use `\str_case:nnTF` to make our boolean here: that way, all that needs to be passed internally are lists of classes.

```

\__text_map_ExtendNumLet:Nnnnn 34471 \cs_new:Npn \__text_map_collect:Nnnnnn #1#2#3#4#5
\__text_map_ExtendNumLet_auxi::Nnnnnn 34472 {
\__text_map_ExtendNumLet_auxii:nNnnnn 34473     \__text_map_lookahead:Nnnnnnw #1 { wordbreak } {#2} { }
34474     { \__text_map_collect_auxi:nnnNnnnn {#3} {#4} {#5} }
34475 }
34476 \cs_new:Npn \__text_map_collect_auxi:nnnNnnnn #1#2#3#4#5#6#7#8
34477 {
34478     \exp_args:Ne \__text_map_collect_auxii:nNnnnnnn
34479     {
34480         \__kernel_codepoint_to_wordbreak_class:n
34481         { \__text_codepoint_from_chars:Nw #8 }
34482     }
34483     #4 {#6} {#1} {#2} {#3} {#8}
34484 }

```

We now need to deal with the three possible positive outcomes of examining the next character. The first is that we have found one of the binding characters that ends the current cycle: we then pass on to the appropriate function. Second, we have the ignored characters: if we find these, we loop back around. Finally, we look at the “in-between” characters: if one is found, we need a further look ahead to reach a decision. Rather than have extra complexity in the setup, we have a hard-coded skipping of **ExtendNumLet** for **WSegSpace** (as **ExtendNumLet** only applies to **ALetter**, **Hebrew_Letter**, **Numeric** and **Katakana**).

```

34485 \cs_new:Npn \__text_map_collect_auxii:nNnnnnnn #1#2#3#4#5#6#7

```

```

34486 {
34487   \str_case:neTF {#1}
34488   {
34489     \tl_map_function:eN
34490     {
34491       #4

34517 }
34518 \cs_new:Npn \__text_map_collect_auxiii:n #1
34519 { \exp_not:n { {#1} { } } }

```

We are now have a character which *may* bind to the previous one if the next character is of the correct class also. So we carry forward the collected material and the conditional character, then look ahead again. If successful, combine together and move on using the new class, otherwise output and restart where we were.

```

34520 \cs_new:Npn \__text_map_collect_auxiv:nnNnnnn #1#2#3#4#5#6#7

34782 { \_text_purify_math_end:w \_text_purify_math_result:n {#1} }

```

For N-type tokens, we first look for a string-context replacement before anything else: this can therefore cover anything. Assuming we don't find one, check to see if we can expand control sequences: if not, they have to be dropped. We also allow for L^AT_EX 2_ε \protect: there's an assumption that we don't have \protect { \oops } or similar, but that's also in the expansion code and seems like a reasonable balance. Notice that we filter out implicit begin/end group tokens to avoid issues.

```

34833   { \_text_purify_encoding_escape:NN }
34834   {
34835     \_text_if_expandable:NTF #1
34836     { \exp_after:wN \_text_purify_loop:w #1 }
34837     { \_text_purify_loop:w }
34838   }
34839 }
34840 \cs_new:Npn \_text_purify_encoding_escape:NN #1#2
34841 {
34842   \_text_purify_store:n {#1}
34843   \_text_purify_loop:w
34844 }

```

(End of definition for \text_purify:n and others. This function is documented on page 305.)

`\text_declare_purify_equivalent:Nn`
`\text_declare_purify_equivalent:Ne`

```

34845 \cs_new_protected:Npn \text_declare_purify_equivalent:Nn #1#2
34846 {
34847   \tl_clear_new:c { l_text_purify_ \token_to_str:N #1 _tl }
34848   \tl_set:cn { l_text_purify_ \token_to_str:N #1 _tl } {#2}
34849 }
34850 \cs_generate_variant:Nn \text_declare_purify_equivalent:Nn { Ne }

```

(End of definition for \text_declare_purify_equivalent:Nn. This function is documented on page 305.)

Now pre-define a range of standard commands that need dedicated definitions in purified text. First handle font-related stuff: all of this needs to be disabled.

```

34851 \tl_map_inline:nn
34852 {
34853   \fontencoding
34854   \fontfamily
34855   \fontseries
34856   \fontshape
34857 }
34858 { \text_declare_purify_equivalent:Nn #1 { \use_none:n } }
34859 \text_declare_purify_equivalent:Nn \fontsize { \use_none:nn }
34860 \text_declare_purify_equivalent:Nn \selectfont { }
34861 \text_declare_purify_equivalent:Nn \usefont { \use_none:n n n n }
34862 \exp_args:Nc \text_declare_purify_equivalent:Nn

```

```
34863 { @protected@testopt } { \use_none:nnn }
```

Environments have to be handled by pure expansion.

```
\__text_end_env:n
```

```
34864 \text_declare_purify_equivalent:Nn \begin { \use:c }
34865 \text_declare_purify_equivalent:Nn \end { \__text_end_env:n }
34866 \cs_new:Npn \__text_end_env:n #1 { \cs:w end #1 \cs_end: }
```

(End of definition for `__text_end_env:n`.)

Some common symbols and similar ideas.

```
34867 \text_declare_purify_equivalent:Nn \ { }
34868 \tl_map_inline:nn
34869 { \{ \} \# \$ \% \_ }
34870 { \text_declare_purify_equivalent:Ne #1 { \cs_to_str:N #1 } }
```

Cross-referencing.

```
34871 \text_declare_purify_equivalent:Nn \label { \use_none:n }
```

Spaces.

```
34872 \group_begin:
34873 \char_set_catcode_active:N \~

93.2 Accent and letter-like data for purifying text

In contrast to case changing, both 8-bit and Unicode engines need information for text purification to handle accents and letter-like functions: these all need to be removed. However, the results are of course engine-dependent.

For the letter-like commands, life is relatively easy: they are all simply added as standard exceptions. The only oddity is `\SS`, which gets converted to two letters. (At some stage an alternative version can presumably be added to `babel` or similar.)

```
34882 \cs_set_protected:Npn \__text_loop:Nn #1#2
34883 {
34884   \quark_if_recursion_tail_stop:N #1
34885   \text_declare_purify_equivalent:Ne #1
34886   {
34887     \codepoint_generate:nn {"#2}
34888     { \char_value_catcode:n {"#2} }
34889   }
34890   \__text_loop:Nn
34891 }
34892 \__text_loop:Nn

34917 \q_recursion_stop
34918 \text_declare_purify_equivalent:Nn \SS { SS }

```

`__text_purify_accent:NN` Accent LICR handling is a little more complex. Accents may exist as pre-composed codepoints or as independent glyphs. The former are all saved as single token lists, whilst for the latter the combining accent needs to be re-ordered compared to the character it applies to.

```

34919 \cs_new:Npn \__text_purify_accent:NN #1#2
34920 {
34921   \cs_if_exist:cTF
34922   { c__text_purify_ \token_to_str:N #1 _ \token_to_str:N #2 _t1 }
34923   {
34924     \exp_not:v
34925     { c__text_purify_ \token_to_str:N #1 _ \token_to_str:N #2 _t1 }
34926   }
34927   {
34928     \exp_not:n {#2}
34929     \exp_not:v { c__text_purify_ \token_to_str:N #1 _t1 }
34930   }
34931 }
34932 \tl_map_inline:nn { \' \' ^ ~ \= \u \. \" \r \H \v \d \c \k \b \t }
34933 { \text_declare_purify_equivalent:Nn #1 { \__text_purify_accent:NN #1 } }

```

First set up the combining accents.

```

34934 \group_begin:
34935   \cs_set_protected:Npn \__text_loop:Nn #1#2
34936   {
34937     \quark_if_recursion_tail_stop:N #1
34938     \tl_const:ce { c__text_purify_ \token_to_str:N #1 _t1 }
34939     { \codepoint_generate:nn {"#2} { \char_value_catcode:n { "#2 } } }
34940     \__text_loop:Nn
34941   }
34942 \__text_loop:Nn
34943 \' { 0300 }

```

```

34944 \' { 0301 }
34945 \^ { 0302 }
34946 \~ { 0303 }
34947 \= { 0304 }
34948 \u { 0306 }
34949 \. { 0307 }
34950 \" { 0308 }
34951 \r { 030A }
34952 \H { 030B }
34953 \v { 030C }
34954 \d { 0323 }
34955 \c { 0327 }
34956 \k { 0328 }
34957 \b { 0331 }
34958 \t { 0361 }
34959 \q_recursion_tail { }
34960 \q_recursion_stop

```

Now we handle the pre-composed accents: the list here is taken from `puenc.def`. All of the precomposed cases take a single letter as their second argument. We do not try to cover the case where an accent is added to a “real” dotless-i or -j, or a æ/Æ. Rather, we assume that if the UTF-8 character is used, it will have the real accent character too.

```

Chapter 94

l3box implementation

```
35181 ⟨*code⟩
35182 ⟨@@=box⟩
```

94.1 Support code

`__box_dim_eval:w` Evaluating a dimension expression expandably. The only difference with `\dim_eval:n` is the lack of `\dim_use:N`, to produce an internal dimension rather than expand it into characters.

```
35183 \cs_new_eq:NN __box_dim_eval:w \tex_dimexpr:D
35184 \cs_new:Npn __box_dim_eval:n #1
35185 { __box_dim_eval:w #1 \scan_stop: }
```

(End of definition for __box_dim_eval:w and __box_dim_eval:n.)

`__kernel_kern:n` We need kerns in a few places. At present, we don't have a module for this concept, so it goes in at first use: here. The idea is to avoid repeated use of the bare primitive.

```
35186 \cs_new_protected:Npn __kernel_kern:n #1
35187 { \tex_kern:D __box_dim_eval:n {#1} }
```

(End of definition for __kernel_kern:n.)

94.2 Creating and initialising boxes

The following test files are used for this code: m3box001.lvt.

`\box_new:N` Defining a new `⟨box⟩` register: remember that box 255 is not generally available.

```
\box_new:c
35188 \cs_new_protected:Npn \box_new:N #1
35189 {
35190   __kernel_chk_if_free_cs:N #1
35191   \cs:w newbox \cs_end: #1
35192 }
35193 \cs_generate_variant:Nn \box_new:N { c }
```

Clear a $\langle\text{box}\rangle$ register.

```

35194 \cs_new_protected:Npn \box_clear:N #1
\box_clear:N { \box_set_eq:NN #1 \c_empty_box }
35195
\box_clear:c 35196 \cs_new_protected:Npn \box_gclear:N #1
\box_gclear:N { \box_gset_eq:NN #1 \c_empty_box }
35197
\box_gclear:c 35198 \cs_generate_variant:Nn \box_clear:N { c }
35199 \cs_generate_variant:Nn \box_gclear:N { c }
```

Clear or new.

```

35200 \cs_new_protected:Npn \box_clear_new:N #1
\box_clear_new:N { \box_if_exist:NTF #1 { \box_clear:N #1 } { \box_new:N #1 } }
35201
\box_clear_new:c 35202 \cs_new_protected:Npn \box_gclear_new:N #1
\box_gclear_new:N { \box_if_exist:NTF #1 { \box_gclear:N #1 } { \box_new:N #1 } }
35203
\box_gclear_new:c 35204 \cs_generate_variant:Nn \box_clear_new:N { c }
35205 \cs_generate_variant:Nn \box_gclear_new:N { c }
```

Assigning the contents of a box to be another box.

```

35206 \cs_new_protected:Npn \box_set_eq:NN #1#2
\box_set_eq:NN { \tex_setbox:D #1 \tex_copy:D #2 }
35207
\box_set_eq:cN 35208 \cs_new_protected:Npn \box_gset_eq:NN #1#2
\box_set_eq:Nc 35209 { \tex_global:D \tex_setbox:D #1 \tex_copy:D #2 }
\box_set_eq:cc 35210 \cs_generate_variant:Nn \box_set_eq:NN { c , Nc , cc }
\box_gset_eq:NN 35211 \cs_generate_variant:Nn \box_gset_eq:NN { c , Nc , cc }
```

Assigning the contents of a box to be another box, then drops the original box.

```

35212 \cs_new_protected:Npn \box_set_eq_drop:NN #1#2
\box_set_eq_drop:NN { \tex_setbox:D #1 \tex_box:D #2 }
35213
\box_set_eq_drop:cN 35214 \cs_new_protected:Npn \box_gset_eq_drop:NN #1#2
\box_set_eq_drop:Nc 35215 { \tex_global:D \tex_setbox:D #1 \tex_box:D #2 }
\box_set_eq_drop:cc 35216 \cs_generate_variant:Nn \box_set_eq_drop:NN { c , Nc , cc }
\box_gset_eq_drop:NN 35217 \cs_generate_variant:Nn \box_gset_eq_drop:NN { c , Nc , cc }
\box_gset_eq_drop:cN
\box_gset_eq_drop:Nc
\box_gset_eq_drop:cc
\box_if_exist:N 35218 \prg_new_eq_conditional:NNn \box_if_exist:N \cs_if_exist:N
\box_if_exist:N { TF , T , F , p }
35219
\box_if_exist:p:c 35220 \prg_new_eq_conditional:NNn \box_if_exist:c \cs_if_exist:c
\box_if_exist:NTF 35221 { TF , T , F , p }
\box_if_exist:cTF
```

Copies of the cs functions defined in l3basics.

94.3 Measuring and setting box dimensions

Accessing the height, depth, and width of a $\langle\text{box}\rangle$ register.

```

35222 \cs_new_eq:NN \box_ht:N \tex_ht:D
\box_ht:N 35223 \cs_new_eq:NN \box_dp:N \tex_dp:D
\box_ht:c 35224 \cs_new_eq:NN \box_wd:N \tex_wd:D
\box_dp:N 35225 \cs_generate_variant:Nn \box_ht:N { c }
\box_dp:c 35226 \cs_generate_variant:Nn \box_dp:N { c }
\box_wd:N 35227 \cs_generate_variant:Nn \box_wd:N { c }
```

The $\backslash\text{box_ht:N}$ and $\backslash\text{box_dp:N}$ primitives do not expand but rather are suitable for use after $\backslash\text{the}$ or inside dimension expressions. Here we obtain the same behaviour by using $\backslash_\text{box_dim_eval:n}$ (basically $\backslash\text{dimexpr}$) rather than $\backslash\text{dim_eval:n}$ (basically $\backslash\text{the } \backslash\text{dimexpr}$).

```

35228 \cs_new_protected:Npn \box_ht_plus_dp:N #1
35229 { \__box_dim_eval:n { \box_ht:N #1 + \box_dp:N #1 } }
35230 \cs_generate_variant:Nn \box_ht_plus_dp:N { c }

```

Setting the size whilst respecting local scope requires copying; the same issue does not come up when working globally. When debugging, the dimension expression #2 is surrounded by parentheses to catch early termination.

```

35268 \cs_new_protected:Npn \box_move_down:nn #1#2
35269 { \tex_lower:D \__box_dim_eval:n {#1} #2 }

```

94.5 Box conditionals

The primitives for testing if a $\langle box \rangle$ is empty/void or which type of box it is.

$\backslash\text{if_hbox:N}$	35270 $\backslash\text{cs_new_eq:NN } \backslash\text{if_hbox:N } \quad \quad \backslash\text{tex_ifhbox:D}$
$\backslash\text{if_vbox:N}$	35271 $\backslash\text{cs_new_eq:NN } \backslash\text{if_vbox:N } \quad \quad \backslash\text{tex_ifvbox:D}$
$\backslash\text{if_box_empty:N}$	35272 $\backslash\text{cs_new_eq:NN } \backslash\text{if_box_empty:N } \backslash\text{tex_ifvoid:D}$
$\backslash\text{box_if_horizontal_p:N}$	35273 $\backslash\text{prg_new_conditional:Npnn } \backslash\text{box_if_horizontal:N } \#1 \{ p , T , F , TF \}$
$\backslash\text{box_if_horizontal_p:c}$	35274 $\{ \backslash\text{if_hbox:N } \#1 \backslash\text{prg_return_true: } \backslash\text{else: } \backslash\text{prg_return_false: } \backslash\text{fi: } \}$
$\backslash\text{box_if_horizontal:N}\underline{TF}$	35275 $\backslash\text{prg_new_conditional:Npnn } \backslash\text{box_if_vertical:N } \#1 \{ p , T , F , TF \}$
$\backslash\text{box_if_horizontal:c}\underline{TF}$	35276 $\{ \backslash\text{if_vbox:N } \#1 \backslash\text{prg_return_true: } \backslash\text{else: } \backslash\text{prg_return_false: } \backslash\text{fi: } \}$
$\backslash\text{box_if_vertical_p:N}$	35277 $\backslash\text{prg_generate_conditional_variant:Nnn } \backslash\text{box_if_horizontal:N}$
$\backslash\text{box_if_vertical_p:c}$	35278 $\{ c \} \{ p , T , F , TF \}$
$\backslash\text{box_if_vertical:N}\underline{TF}$	35279 $\backslash\text{prg_generate_conditional_variant:Nnn } \backslash\text{box_if_vertical:N}$
$\backslash\text{box_if_vertical:c}\underline{TF}$	35280 $\{ c \} \{ p , T , F , TF \}$

Testing if a $\langle box \rangle$ is empty/void.

$\backslash\text{box_if_empty_p:N}$	35281 $\backslash\text{prg_new_conditional:Npnn } \backslash\text{box_if_empty:N } \#1 \{ p , T , F , TF \}$
$\backslash\text{box_if_empty_p:c}$	35282 $\{ \backslash\text{if_box_empty:N } \#1 \backslash\text{prg_return_true: } \backslash\text{else: } \backslash\text{prg_return_false: } \backslash\text{fi: } \}$
$\backslash\text{box_if_empty:N}\underline{TF}$	35283 $\backslash\text{prg_generate_conditional_variant:Nnn } \backslash\text{box_if_empty:N}$
$\backslash\text{box_if_empty:c}\underline{TF}$	35284 $\{ c \} \{ p , T , F , TF \}$

(End of definition for $\backslash\text{box_new:N}$ and others. These functions are documented on page 309.)

94.6 The last box inserted

$\backslash\text{box_set_to_last:N}$	Set a box to the previous box.
$\backslash\text{box_set_to_last:c}$	35285 $\backslash\text{cs_new_protected:Npn } \backslash\text{box_set_to_last:N } \#1$
$\backslash\text{box_gset_to_last:N}$	35286 $\{ \backslash\text{tex_setbox:D } \#1 \backslash\text{tex_lastbox:D } \}$
$\backslash\text{box_gset_to_last:c}$	35287 $\backslash\text{cs_new_protected:Npn } \backslash\text{box_gset_to_last:N } \#1$
	35288 $\{ \backslash\text{tex_global:D } \backslash\text{tex_setbox:D } \#1 \backslash\text{tex_lastbox:D } \}$
	35289 $\backslash\text{cs_generate_variant:Nn } \backslash\text{box_set_to_last:N } \{ c \}$
	35290 $\backslash\text{cs_generate_variant:Nn } \backslash\text{box_gset_to_last:N } \{ c \}$

(End of definition for $\backslash\text{box_set_to_last:N}$ and $\backslash\text{box_gset_to_last:N}$. These functions are documented on page 312.)

94.7 Constant boxes

$\backslash\text{c_empty_box}$ A box we never use.

35291 $\backslash\text{box_new:N } \backslash\text{c_empty_box}$

(End of definition for $\backslash\text{c_empty_box}$. This variable is documented on page 312.)

94.8 Scratch boxes

```
\l_tmpa_box Scratch boxes.
\l_tmpb_box 35292 \box_new:N \l_tmpa_box
\g_tmpa_box 35293 \box_new:N \l_tmpb_box
\g_tmpb_box 35294 \box_new:N \g_tmpa_box
35295 \box_new:N \g_tmpb_box
```

(End of definition for `\l_tmpa_box` and others. These variables are documented on page 312.)

94.9 Viewing box contents

TeX's `\showbox` is not really that helpful in many cases, and it is also inconsistent with other L^AT_EX3 show functions as it does not actually shows material in the terminal. So we provide a richer set of functionality.

```
\box_show:N Essentially a wrapper around the internal function, but evaluating the breadth and depth
\box_show:c arguments now outside the group.
\box_show:Nnn 35296 \cs_new_protected:Npn \box_show:N #1
\box_show:cnn 35297 { \box_show:Nnn #1 \c_max_int \c_max_int }
35298 \cs_generate_variant:Nn \box_show:N { c }
35299 \cs_new_protected:Npn \box_show:Nnn #1#2#3
35300 { \__box_show:NNff 1 #1 { \int_eval:n {#2} } { \int_eval:n {#3} } }
35301 \cs_generate_variant:Nn \box_show:Nnn { c }
```

(End of definition for `\box_show:N` and `\box_show:Nnn`. These functions are documented on page 313.)

```
\box_log:N Getting TeX to write to the log without interruption the run is done by altering the
\box_log:c interaction mode. For that, the  $\epsilon$ -TeX extensions are needed.
\box_log:Nnn 35302 \cs_new_protected:Npn \box_log:N #1
\box_log:cnn 35303 { \box_log:Nnn #1 \c_max_int \c_max_int }
\__box_log:nNnn 35304 \cs_generate_variant:Nn \box_log:N { c }
35305 \cs_new_protected:Npn \box_log:Nnn
35306 { \exp_args:No \__box_log:nNnn { \tex_the:D \tex_interactionmode:D } }
35307 \cs_new_protected:Npn \__box_log:nNnn #1#2#3#4
35308 {
35309 \int_gset:Nn \tex_interactionmode:D { 0 }
35310 \__box_show:NNff 0 #2 { \int_eval:n {#3} } { \int_eval:n {#4} }
35311 \int_gset:Nn \tex_interactionmode:D {#1}
35312 }
35313 \cs_generate_variant:Nn \box_log:Nnn { c }
```

(End of definition for `\box_log:N`, `\box_log:Nnn`, and `__box_log:nNnn`. These functions are documented on page 313.)

```
\__box_show:NNnn The internal auxiliary to actually do the output uses a group to deal with breadth and
\__box_show:NNff depth values. The \use:n here gives better output appearance. Setting \tracingonline
and \errorcontextlines is used to control what appears in the terminal.
35314 \cs_new_protected:Npn \__box_show:NNnn #1#2#3#4
35315 {
35316 \box_if_exist:NTF #2
35317 {
35318 \group_begin:
```

```

35319         \int_set:Nn \tex_showboxbreadth:D {#3}
35320         \int_set:Nn \tex_showboxdepth:D {#4}
35321         \int_set:Nn \tex_tracingonline:D {#1}
35322         \int_set:Nn \tex_errorcontextlines:D { -1 }
35323         \tex_showbox:D \use:n {#2}
35324     \group_end:
35325 }
35326 {
35327     \msg_error:nne { kernel } { variable-not-defined }
35328     { \token_to_str:N #2 }
35329 }
35330 }
35331 \cs_generate_variant:Nn \__box_show:NNnn { NNff }

```

(End of definition for __box_show:NNnn.)

94.10 Horizontal mode boxes

\hbox:n (The test suite for this command, and others in this file, is *m3box002.lvt*.)

Put a horizontal box directly into the input stream.

```

35332 \cs_new_protected:Npn \hbox:n #1
35333 { \tex_hbox:D \scan_stop: { \color_group_begin: #1 \color_group_end: } }

```

(End of definition for \hbox:n. This function is documented on page [313](#).)

\hbox_set:Nn

\hbox_set:cn

\hbox_gset:Nn

\hbox_gset:cn

```

35334 \cs_new_protected:Npn \hbox_set:Nn #1#2
35335 {
35336     \tex_setbox:D #1 \tex_hbox:D
35337     { \color_group_begin: #2 \color_group_end: }
35338 }
35339 \cs_new_protected:Npn \hbox_gset:Nn #1#2
35340 {
35341     \tex_global:D \tex_setbox:D #1 \tex_hbox:D
35342     { \color_group_begin: #2 \color_group_end: }
35343 }
35344 \cs_generate_variant:Nn \hbox_set:Nn { c }
35345 \cs_generate_variant:Nn \hbox_gset:Nn { c }

```

(End of definition for \hbox_set:Nn and \hbox_gset:Nn. These functions are documented on page [313](#).)

\hbox_set_to_wd:Nnn

\hbox_set_to_wd:cnn

\hbox_gset_to_wd:Nnn

\hbox_gset_to_wd:cnn

Storing material in a horizontal box with a specified width. Again, put the dimension expression in parentheses when debugging.

```

35346 \cs_new_protected:Npn \hbox_set_to_wd:Nnn #1#2#3
35347 {
35348     \tex_setbox:D #1 \tex_hbox:D to \__box_dim_eval:n {#2}
35349     { \color_group_begin: #3 \color_group_end: }
35350 }
35351 \cs_new_protected:Npn \hbox_gset_to_wd:Nnn #1#2#3
35352 {
35353     \tex_global:D \tex_setbox:D #1 \tex_hbox:D to \__box_dim_eval:n {#2}
35354     { \color_group_begin: #3 \color_group_end: }
35355 }
35356 \cs_generate_variant:Nn \hbox_set_to_wd:Nnn { c }
35357 \cs_generate_variant:Nn \hbox_gset_to_wd:Nnn { c }

```

(End of definition for `\hbox_set_to_wd:Nnn` and `\hbox_gset_to_wd:Nnn`. These functions are documented on page 314.)

`\hbox_set:Nw` Storing material in a horizontal box. This type is useful in environment definitions.

`\hbox_set:cw` 35358 `\cs_new_protected:Npn \hbox_set:Nw #1`

`\hbox_gset:Nw` 35359 `{`

35396 `}`

35397 `\cs_new_protected:Npn \hbox_to_zero:nn #1`

35398 `{`

35399 `\tex_hbox:D to \c_zero_dim`

```

35400     { \color_group_begin: #1 \color_group_end: }
35401   }

```

(End of definition for `\hbox_to_wd:nn` and `\hbox_to_zero:n`. These functions are documented on page 313.)

`\hbox_overlap_center:n` Put a zero-sized box with the contents pushed against one side (which makes it stick out on the other) directly into the input stream.

```

\hbox_overlap_left:n
\hbox_overlap_right:n
35402 \cs_new_protected:Npn \hbox_overlap_center:n #1
35403   { \hbox_to_zero:n { \tex_hss:D #1 \tex_hss:D } }
35404 \cs_new_protected:Npn \hbox_overlap_left:n #1
35405   { \hbox_to_zero:n { \tex_hss:D #1 } }
35406 \cs_new_protected:Npn \hbox_overlap_right:n #1
35407   { \hbox_to_zero:n { #1 \tex_hss:D } }

```

(End of definition for `\hbox_overlap_center:n`, `\hbox_overlap_left:n`, and `\hbox_overlap_right:n`. These functions are documented on page 314.)

```

\hbox_unpack:N      Unpacking a box and if requested also clear it.
\hbox_unpack:c      35408 \cs_new_eq:NN \hbox_unpack:N \tex_unhcopy:D
\hbox_unpack_drop:N 35409 \cs_new_eq:NN \hbox_unpack_drop:N \tex_unhbox:D
\hbox_unpack_drop:c 35410 \cs_generate_variant:Nn \hbox_unpack:N { c }
                    35411 \cs_generate_variant:Nn \hbox_unpack_drop:N { c }

```

(End of definition for `\hbox_unpack:N` and `\hbox_unpack_drop:N`. These functions are documented on page 314.)

94.11 Vertical mode boxes

TeX ends these boxes directly with the internal `end_graf` routine. This means that there is no `\par` at the end of vertical boxes unless we insert one. Thus all vertical boxes include a `\par` just before closing the color group.

`\vbox:n` The following test files are used for this code: `m3box003.lvt`.

The following test files are used for this code: `m3box003.lvt`.

```

\vbox_top:n      Put a vertical box directly into the input stream.
35412 \cs_new_protected:Npn \vbox:n #1
35413   { \tex_vbox:D { \color_group_begin: #1 \par \color_group_end: } }
35414 \cs_new_protected:Npn \vbox_top:n #1
35415   { \tex_vtop:D { \color_group_begin: #1 \par \color_group_end: } }

```

(End of definition for `\vbox:n` and `\vbox_top:n`. These functions are documented on page 315.)

```

\vbox_to_ht:nn    Put a vertical box directly into the input stream.
\vbox_to_zero:n    35416 \cs_new_protected:Npn \vbox_to_ht:nn #1#2
\vbox_to_ht:nn    35417   {
\vbox_to_zero:n    35418     \tex_vbox:D to \__box_dim_eval:n {#1}
                    35419     { \color_group_begin: #2 \par \color_group_end: }
35420   }
35421 \cs_new_protected:Npn \vbox_to_zero:n #1
35422   {
35423     \tex_vbox:D to \c_zero_dim
35424     { \color_group_begin: #1 \par \color_group_end: }
35425   }

```

(End of definition for `\vbox_to_ht:nn` and others. These functions are documented on page 315.)

`\vbox_set:Nn` Storing material in a vertical box with a natural height.
`\vbox_set:cn`
`\vbox_gset:Nn`
`\vbox_gset:cn`

```

35426 \cs_new_protected:Npn \vbox_set:Nn #1#2
35427 {
35428   \tex_setbox:D #1 \tex_vbox:D
35429   { \color_group_begin: #2 \par \color_group_end: }
35430 }

35520 \dim_new:N \l__box_right_new_dim

```

(End of definition for `\l__box_top_new_dim` and others.)

`\l__box_internal_box` Scratch space, but also needed by some parts of the driver.

```
35521 \box_new:N \l__box_internal_box
```

(End of definition for `\l__box_internal_box`.)

Figure 2: Coordinates of a box prior to rotation.

\box_rotate:Nn Rotation of a box starts with working out the relevant sine and cosine. The actual
\box_rotate:cn rotation is in an auxiliary to keep the flow slightly clearer

\box_grotate:Nn 35522 \cs_new_protected:Npn \box_rotate:Nn #1#2

\box_grotate:cn 35523 { __box_rotate:NnN #1 {#2} \hbox_set:Nn }

__box_rotate:NnN 35524 \cs_generate_variant:Nn \box_rotate:Nn { c }

__box_rotate:N 35525 \cs_new_protected:Npn \box_grotate:Nn #1#2

__box_rotate_xdir:nnN 35526 { __box_rotate:NnN #1 {#2} \hbox_gset:Nn }

__box_rotate_ydir:nnN 35527 \cs_generate_variant:Nn \box_grotate:Nn { c }

__box_rotate_quadrant_one: 35528 \cs_new_protected:Npn __box_rotate:NnN #1#2#3

__box_rotate_quadrant_two: 35529 {

__box_rotate_quadrant_three: 35530 #3 #1

__box_rotate_quadrant_four: 35531 {

35532 \fp_set:Nn \l__box_angle_fp {#2}

35533 \fp_set:Nn \l__box_sin_fp { sind (\l__box_angle_fp) }

35534 \fp_set:Nn \l__box_cos_fp { cosd (\l__box_angle_fp) }

35535 __box_rotate:N #1

35536 }

35537 }

The edges of the box are then recorded: the left edge is always at zero. Rotation of the four edges then takes place: this is most efficiently done on a quadrant by quadrant basis.

35538 \cs_new_protected:Npn __box_rotate:N #1

35539 {

35540 \dim_set:Nn \l__box_top_dim { \box_ht:N #1 }

35541 \dim_set:Nn \l__box_bottom_dim { -\box_dp:N #1 }

35542 \dim_set:Nn \l__box_right_dim { \box_wd:N #1 }

35543 \dim_zero:N \l__box_left_dim

The next step is to work out the x and y coordinates of vertices of the rotated box in relation to its original coordinates. The box can be visualized with vertices B , C , D and E is illustrated (Figure 2). The vertex O is the reference point on the baseline, and in this implementation is also the centre of rotation. The formulae are, for a point P and angle α :

$$\begin{aligned} P'_x &= P_x - O_x \\ P'_y &= P_y - O_y \\ P''_x &= (P'_x \cos(\alpha)) - (P'_y \sin(\alpha)) \\ P''_y &= (P'_x \sin(\alpha)) + (P'_y \cos(\alpha)) \\ P'''_x &= P''_x + O_x + L_x \\ P'''_y &= P''_y + O_y \end{aligned}$$

The “extra” horizontal translation L_x at the end is calculated so that the leftmost point of the resulting box has x -coordinate 0. This is desirable as \TeX boxes must have the reference point at the left edge of the box. (As O is always $(0,0)$, this part of the calculation is omitted here.)

```

35544 \fp_compare:nNnTF \l__box_sin_fp > \c_zero_fp
35545 {
35546   \fp_compare:nNnTF \l__box_cos_fp > \c_zero_fp
35547   { \__box_rotate_quadrant_one: }
35548   { \__box_rotate_quadrant_two: }
35549 }
35550 {
35551   \fp_compare:nNnTF \l__box_cos_fp < \c_zero_fp
35552   { \__box_rotate_quadrant_three: }
35553   { \__box_rotate_quadrant_four: }
35554 }

```

The position of the box edges are now known, but the box at this stage be misplaced relative to the current \TeX reference point. So the content of the box is moved such that the reference point of the rotated box is in the same place as the original.

```

35555 \hbox_set:Nn \l__box_internal_box { \box_use:N #1 }
35556 \hbox_set:Nn \l__box_internal_box
35557 {
35558   \__kernel_kern:n { -\l__box_left_new_dim }
35559   \hbox:n
35560   {
35561     \__box_backend_rotate:Nn
35562     \l__box_internal_box
35563     \l__box_angle_fp
35564   }
35565 }

```

Tidy up the size of the box so that the material is actually inside the bounding box. The result can then be used to reset the original box.

```

35566 \box_set_ht:Nn \l__box_internal_box { \l__box_top_new_dim }
35567 \box_set_dp:Nn \l__box_internal_box { -\l__box_bottom_new_dim }
35568 \box_set_wd:Nn \l__box_internal_box
35569 { \l__box_right_new_dim - \l__box_left_new_dim }
35570 \box_use_drop:N \l__box_internal_box
35571 }

```

These functions take a general point $(\#1,\#2)$ and rotate its location about the origin, using the previously-set sine and cosine values. Each function gives only one component of the location of the updated point. This is because for rotation of a box each step needs only one value, and so performance is gained by avoiding working out both x' and y' at the same time. Contrast this with the equivalent function in the `l3coffins` module, where both parts are needed.

```

35572 \cs_new_protected:Npn \__box_rotate_xdir:nnN #1#2#3
35573 {
35574   \dim_set:Nn #3
35575   {
35576     \fp_to_dim:n
35577     {
35578       \l__box_cos_fp * \dim_to_fp:n {#1}

```

```

35580     }
35581   }
35582 }
35583 \cs_new_protected:Npn \__box_rotate_ydir:nnN #1#2#3
35584 {
35585   \dim_set:Nn #3
35586   {
35587     \fp_to_dim:n
35588     {
35589       \l__box_sin_fp * \dim_to_fp:n {#1}
35590       + \l__box_cos_fp * \dim_to_fp:n {#2}
35591     }
35592   }
35593 }

```

Rotation of the edges is done using a different formula for each quadrant. In every case, the top and bottom edges only need the resulting y -values, whereas the left and right edges need the x -values. Each case is a question of picking out which corner ends up at with the maximum top, bottom, left and right value. Doing this by hand means a lot less calculating and avoids lots of comparisons.

35672 \dim_zero:N \l__box_left_dim
35673 }

```

With at least one real scaling to do, the next phase is to find the new edge coordinates. In the x direction this is relatively easy: just scale the right edge. In the y direction, both dimensions have to be scaled, and this again needs the absolute scale value. Once that is all done, the common resize/rescale code can be employed.

```

\box_scale:Nnn When scaling a box, setting the scaling itself is easy enough. The new dimensions are also relatively easy to find, allowing only for the need to keep them positive in all cases. **\box_scale:cnn** Once that is done then after a check for the trivial scaling a hand-off can be made to the common code. **\box_gscale:Nnn** The code here is split into two as this allows sharing with the auto-resizing functions. **\box_gscale:cnn**

```

(End of definition for `\box_autosize_to_wd_and_ht:Nnn` and others. These functions are documented on page 318.)

`__box_resize_common:N` The main resize function places its input into a box which start off with zero width, and includes the handles for engine rescaling.

```

35827 \cs_new_protected:Npn \__box_resize_common:N #1
35828 {
35829   \hbox_set:Nn \l__box_internal_box
35830   {
35831     \__box_backend_scale:Nnn
35832     #1
35833     \l__box_scale_x_fp
35834     \l__box_scale_y_fp
35835   }

```

The new height and depth can be applied directly.

```

35836   \fp_compare:nNnTF \l__box_scale_y_fp > \c_zero_fp
35837   {
35838     \box_set_ht:Nn \l__box_internal_box { \l__box_top_new_dim }
35839     \box_set_dp:Nn \l__box_internal_box { -\l__box_bottom_new_dim }
35840   }
35841   {
35842     \box_set_dp:Nn \l__box_internal_box { \l__box_top_new_dim }
35843     \box_set_ht:Nn \l__box_internal_box { -\l__box_bottom_new_dim }
35844   }

```

Things are not quite as obvious for the width, as the reference point needs to remain unchanged. For positive scaling factors resizing the box is all that is needed. However, for case of a negative scaling the material must be shifted such that the reference point ends up in the right place.

```

35845   \fp_compare:nNnTF \l__box_scale_x_fp < \c_zero_fp
35846   {

```

```

35882         \__kernel_kern:n { -#4 }
35883     }

```

For the height and depth, there is a need to watch the baseline is respected. Material always has to stay on the correct side, so trimming has to check that there is enough material to trim. First, the bottom edge. If there is enough depth, simply set the depth, or if not move down so the result is zero depth. `\box_move_down:nn` is used in both

cases so the resulting box always contains a \lower primitive. The internal box is used here as it allows safe use of \box_set_dp:Nn.

```

35884 \dim_compare:nNnTF { \box_dp:N #1 } > {#3}

35972 }

```

(End of definition for `\box_set_viewport:Nnnnn`, `\box_gset_viewport:Nnnnn`, and `__box_viewport:NnnnnN`. These functions are documented on page 320.)

35973 `\code`

Chapter 95

l3coffins implementation

```
35974 <*code>
35975 <@@=coffin>
```

95.1 Coffins: data structures and general variables

`\l__coffin_internal_box` Scratch variables.

```
\l__coffin_internal_dim 35976 \box_new:N \l__coffin_internal_box
\l__coffin_internal_tl 35977 \dim_new:N \l__coffin_internal_dim
35978 \tl_new:N \l__coffin_internal_tl
```

(End of definition for \l__coffin_internal_box, \l__coffin_internal_dim, and \l__coffin_internal_tl.)

`\c__coffin_corners_prop` The “corners”; of a coffin define the real content, as opposed to the TeX bounding box. They all start off in the same place, of course.

```
35979 \prop_const_from_keyval:Nn \c__coffin_corners_prop
35980 {
35981   tl = { 0pt } { 0pt } ,
35982   tr = { 0pt } { 0pt } ,
35983   bl = { 0pt } { 0pt } ,
35984   br = { 0pt } { 0pt } ,
35985 }
```

(End of definition for \c__coffin_corners_prop.)

`\c__coffin_poles_prop` Pole positions are given for horizontal, vertical and reference-point based values.

```
35986 \prop_const_from_keyval:Nn \c__coffin_poles_prop
35987 {
35988   l  = { 0pt } { 0pt } { 0pt } { 1000pt } ,
35989   hc = { 0pt } { 0pt } { 0pt } { 1000pt } ,
35990   r  = { 0pt } { 0pt } { 0pt } { 1000pt } ,
35991   b  = { 0pt } { 0pt } { 1000pt } { 0pt } ,
35992   vc = { 0pt } { 0pt } { 1000pt } { 0pt } ,
35993   t  = { 0pt } { 0pt } { 1000pt } { 0pt } ,
35994   B  = { 0pt } { 0pt } { 1000pt } { 0pt } ,
35995   H  = { 0pt } { 0pt } { 1000pt } { 0pt } ,
35996   T  = { 0pt } { 0pt } { 1000pt } { 0pt } ,
35997 }
```

(End of definition for `\c__coffin_poles_prop`.)

`\l__coffin_slope_A_fp` Used for calculations of intersections.

`\l__coffin_slope_B_fp` 35998 `\fp_new:N \l__coffin_slope_A_fp`
35999 `\fp_new:N \l__coffin_slope_B_fp`

(End of definition for `\l__coffin_slope_A_fp` and `\l__coffin_slope_B_fp`.)

`\l__coffin_error_bool` For propagating errors so that parts of the code can work around them.

36000 `\bool_new:N \l__coffin_error_bool`

(End of definition for `\l__coffin_error_bool`.)

`\l__coffin_offset_x_dim` The offset between two sets of coffin handles when typesetting. These values are corrected
`\l__coffin_offset_y_dim` from those requested in an alignment for the positions of the handles.

36001 `\dim_new:N \l__coffin_offset_x_dim`
36002 `\dim_new:N \l__coffin_offset_y_dim`

(End of definition for `\l__coffin_offset_x_dim` and `\l__coffin_offset_y_dim`.)

`\l__coffin_pole_a_tl` Needed for finding the intersection of two poles.

`\l__coffin_pole_b_tl` 36003 `\tl_new:N \l__coffin_pole_a_tl`
36004 `\tl_new:N \l__coffin_pole_b_tl`

(End of definition for `\l__coffin_pole_a_tl` and `\l__coffin_pole_b_tl`.)

`\l__coffin_x_dim` For calculating intersections and so forth.

`\l__coffin_y_dim` 36005 `\dim_new:N \l__coffin_x_dim`
`\l__coffin_x_prime_dim` 36006 `\dim_new:N \l__coffin_y_dim`
`\l__coffin_y_prime_dim` 36007 `\dim_new:N \l__coffin_x_prime_dim`
36008 `\dim_new:N \l__coffin_y_prime_dim`

(End of definition for `\l__coffin_x_dim` and others.)

95.2 Basic coffin functions

There are a number of basic functions needed for creating coffins and placing material in them. This all relies on the following data structures.

`__coffin_to_value:N` Coffins are a two-part structure and we rely on the internal nature of box allocation to make everything work. As such, we need an interface to turn coffin identifiers into numbers. For the purposes here, the signature allowed is N despite the nature of the underlying primitive.

36009 `\cs_new_eq:NN __coffin_to_value:N \tex_number:D`

(End of definition for `__coffin_to_value:N`.)

`\coffin_if_exist_p:N` Several of the higher-level coffin functions would give multiple errors if the coffin does not exist. A cleaner way to handle this is provided here: both the box and the coffin structure are checked.

```

\coffin_if_exist_p:c
\coffin_if_exist:NTF
\coffin_if_exist:cTF
36010 \prg_new_conditional:Npnn \coffin_if_exist:N #1 { p , T , F , TF }
36011 {
36012   \cs_if_exist:NTF #1
36013   {
36014     \cs_if_exist:cTF { coffin ~ \__coffin_to_value:N #1 ~ poles }
36015     { \prg_return_true: }
36016     { \prg_return_false: }
36017   }
36018   { \prg_return_false: }
36019 }
36020 \prg_generate_conditional_variant:Nnn \coffin_if_exist:N
36021 { c } { p , T , F , TF }

```

(End of definition for `\coffin_if_exist:NTF`. This function is documented on page 323.)

`__coffin_if_exist:NT` Several of the higher-level coffin functions would give multiple errors if the coffin does not exist. So a wrapper is provided to deal with this correctly, issuing an error on erroneous use.

```

36022 \cs_new_protected:Npn \__coffin_if_exist:NT #1#2
36023 {
36024   \coffin_if_exist:NTF #1
36025   { #2 }
36026   {
36027     \msg_error:nne { coffin } { unknown }
36028     { \token_to_str:N #1 }
36029   }
36030 }

```

(End of definition for `__coffin_if_exist:NT`.)

`\coffin_clear:N` Clearing coffins means emptying the box and resetting all of the structures.

```

\coffin_clear:c
\coffin_gclear:N
\coffin_gclear:c
36031 \cs_new_protected:Npn \coffin_clear:N #1
36032 {
36033   \__coffin_if_exist:NT #1
36034   {
36035     \box_clear:N #1
36036     \__coffin_reset_structure:N #1
36037   }
36038 }
36039 \cs_generate_variant:Nn \coffin_clear:N { c }
36040 \cs_new_protected:Npn \coffin_gclear:N #1
36041 {
36042   \__coffin_if_exist:NT #1
36043   {
36044     \box_gclear:N #1
36045     \__coffin_greset_structure:N #1
36046   }
36047 }
36048 \cs_generate_variant:Nn \coffin_gclear:N { c }

```

(End of definition for `\coffin_clear:N` and `\coffin_gclear:N`. These functions are documented on page 323.)

\coffin_new:N Creating a new coffin means making the underlying box and adding the data structures. The **\debug_suspend:** and **\debug_resume:** functions prevent **\prop_gclear_new:c** from writing useless information to the log file.

```

36049 \cs_new_protected:Npn \coffin_new:N #1
36050 {
36051   \box_new:N #1
36052   \debug_suspend:
36053   \prop_gclear_new:c { coffin ~ \__coffin_to_value:N #1 ~ corners }
36054   \prop_gclear_new:c { coffin ~ \__coffin_to_value:N #1 ~ poles }
36055   \prop_gset_eq:cN { coffin ~ \__coffin_to_value:N #1 ~ corners }
36056   \c__coffin_corners_prop
36057   \prop_gset_eq:cN { coffin ~ \__coffin_to_value:N #1 ~ poles }
36058   \c__coffin_poles_prop
36059   \debug_resume:
36060 }
36061 \cs_generate_variant:Nn \coffin_new:N { c }

```

(End of definition for **\coffin_new:N**. This function is documented on page 323.)

\hcoffin_set:Nn Horizontal coffins are relatively easy: set the appropriate box, reset the structures then update the handle positions.

```

\hcoffin_set:cn
\hcoffin_gset:Nn
\hcoffin_gset:cn
36062 \cs_new_protected:Npn \hcoffin_set:Nn #1#2
36063 {
36064   \__coffin_if_exist:NT #1
36065   {
36066     \hbox_set:Nn #1
36067     {
36068       \color_ensure_current:
36069       #2
36070     }
36071     \coffin_reset_poles:N #1
36072   }
36073 }
36074 \cs_generate_variant:Nn \hcoffin_set:Nn { c }
36075 \cs_new_protected:Npn \hcoffin_gset:Nn #1#2
36076 {
36077   \__coffin_if_exist:NT #1
36078   {
36079     \hbox_gset:Nn #1
36080     {
36081       \color_ensure_current:
36082       #2
36083     }
36084     \coffin_greset_poles:N #1
36085   }
36086 }
36087 \cs_generate_variant:Nn \hcoffin_gset:Nn { c }

```

(End of definition for **\hcoffin_set:Nn** and **\hcoffin_gset:Nn**. These functions are documented on page 324.)

\vcoffin_set:Nnn Setting vertical coffins is more complex. First, the material is typeset with a given width. The default handles and poles are set as for a horizontal coffin, before finding the top baseline using a temporary box. No **\color_ensure_current:** here as that would add a

\vcoffin_gset:cnn

__coffin_set_vertical:NnnNNN

__coffin_set_vertical_aux:

whatsit to the start of the vertical box and mess up the location of the T pole (see *TEX by Topic* for discussion of the `\vtop` primitive, used to do the measuring).

95.4 Coffins: handle and pole management

`__coffin_get_pole:NnN` A simple wrapper around the recovery of a coffin pole, with some error checking and recovery built-in.

```

36244 \cs_new_protected:Npn \__coffin_get_pole:NnN #1#2#3
36245 {
36246   \prop_get:cnNF
36247     { coffin ~ \__coffin_to_value:N #1 ~ poles } {#2} #3
36248   {
36249     \msg_error:nnee { coffin } { unknown-pole }
36250     { \exp_not:n {#2} } { \token_to_str:N #1 }
36251     \tl_set:Nn #3 { { Opt } { Opt } { Opt } { Opt } }
36252   }
36253 }

```

(End of definition for `__coffin_get_pole:NnN`.)

```

\__coffin_reset_structure:N Resetting the structure is a simple copy job.
\__coffin_greset_structure:N
36254 \cs_new_protected:Npn \__coffin_reset_structure:N #1
36255 {
36256   \prop_set_eq:cN { coffin ~ \__coffin_to_value:N #1 ~ corners }

```

(End of definition for __coffin_reset_structure:N and __coffin_greset_structure:N.)

Setting the pole of a coffin at the user/designer level requires a bit more care. The idea here is to provide a reasonable interface to the system, then to do the setting with full expansion. The three-argument version is used internally to do a direct setting.

95.5 Coffins: calculation of pole intersections

```

__coffin_calculate_intersection:Nnn
__coffin_calculate_intersection:nnnnnnnn
__coffin_calculate_intersection:nnnnnn

```

The lead off in finding intersections is to recover the two poles and then hand off to the auxiliary for the actual calculation. There may of course not be an intersection, for which an error trap is needed.

```

36401 \cs_new_protected:Npn __coffin_calculate_intersection:Nnn #1#2#3
36402 {
36403     __coffin_get_pole:NnN #1 {#2} \l__coffin_pole_a_tl
36404     __coffin_get_pole:NnN #1 {#3} \l__coffin_pole_b_tl
36405     \bool_set_false:N \l__coffin_error_bool
36406     \exp_last_two_unbraced:Noo
36407         __coffin_calculate_intersection:nnnnnnnn
36408         \l__coffin_pole_a_tl \l__coffin_pole_b_tl
36409     \bool_if:NT \l__coffin_error_bool
36410     {
36411         \msg_error:nn { coffin } { no-pole-intersection }
36412         \dim_zero:N \l__coffin_x_dim
36413         \dim_zero:N \l__coffin_y_dim
36414     }
36415 }

```

The two poles passed here each have four values (as dimensions), (a, b, c, d) and (a', b', c', d') . These are arguments 1–4 and 5–8, respectively. In both cases a and b are the coordinates of a point on the pole and c and d define the direction of the pole. Finding the intersection depends on the directions of the poles, which are given by d/c and d'/c' . However, if one of the poles is either horizontal or vertical then one or more of c, d, c' and d' are zero and a special case is needed.

```

36416 \cs_new_protected:Npn __coffin_calculate_intersection:nnnnnnnn
36417     #1#2#3#4#5#6#7#8
36418 {
36419     \dim_compare:nNnTF {#3} = \c_zero_dim

```

The case where the first pole is vertical. So the x -component of the interaction is at a . There is then a test on the second pole: if it is also vertical then there is an error.

```

36420     {
36421         \dim_set:Nn \l__coffin_x_dim {#1}
36422         \dim_compare:nNnTF {#7} = \c_zero_dim
36423         { \bool_set_true:N \l__coffin_error_bool }

```

The second pole may still be horizontal, in which case the y -component of the intersection is b' . If not,

$$y = \frac{d'}{c'} (a - a') + b'$$

with the x -component already known to be $\#1$.

```

36424     {
36425         \dim_set:Nn \l__coffin_y_dim
36426         {

```

```

36427         \dim_compare:nNnTF {#8} = \c_zero_dim
36428         {#6}
36429         {
36430             \fp_to_dim:n
36431             {
36432                 ( \dim_to_fp:n {#8} / \dim_to_fp:n {#7} )
36433                 * ( \dim_to_fp:n {#1} - \dim_to_fp:n {#5} )
36434                 + \dim_to_fp:n {#6}
36435             }
36436         }
36437     }
36438 }
36439 }

```

If the first pole is not vertical then it may be horizontal. If so, then the procedure is essentially the same as that already done but with the x - and y -components interchanged.

```

36440 {
36441     \dim_compare:nNnTF {#4} = \c_zero_dim
36442     {
36443         \dim_set:Nn \l__coffin_y_dim {#2}
36444         \dim_compare:nNnTF {#8} = { \c_zero_dim }
36445         { \bool_set_true:N \l__coffin_error_bool }
36446     }

```

Now we deal with the case where the second pole may be vertical, or if not we have

$$x = \frac{c'}{d'}(b - b') + a'$$

which is again handled by the same auxiliary.

```

36447     \dim_set:Nn \l__coffin_x_dim
36448     {
36449         \dim_compare:nNnTF {#7} = \c_zero_dim
36450         {#5}
36451         {
36452             \fp_to_dim:n
36453             {
36454                 ( \dim_to_fp:n {#7} / \dim_to_fp:n {#8} )
36455                 * ( \dim_to_fp:n {#4} - \dim_to_fp:n {#6} )
36456                 + \dim_to_fp:n {#5}
36457             }
36458         }
36459     }
36460 }
36461 }

```

The first pole is neither horizontal nor vertical. To avoid even more complexity, we now work out both slopes and pass to an auxiliary.

```

36462 {
36463     \use:e
36464     {
36465         \__coffin_calculate_intersection:nnnnnn
36466         { \dim_to_fp:n {#4} / \dim_to_fp:n {#3} }
36467         { \dim_to_fp:n {#8} / \dim_to_fp:n {#7} }
36468     }
36469     {#1} {#2} {#5} {#6}

```

```

36470     }
36471   }
36472 }

```

Assuming the two poles are not parallel, then the intersection point is found in two steps. First we find the x -value with

$$x = \frac{sa - s'a' - b + b'}{s - s'}$$

and then finding the y -value with

$$y = s(x - a) + b$$

```

36473 \cs_new_protected:Npn \__coffin_calculate_intersection:nnnnnn #1#2#3#4#5#6
36474 {

36500   }
36501 }

```

(End of definition for `__coffin_calculate_intersection:Nnn`, `__coffin_calculate_intersection:nnnnnnnn`, and `__coffin_calculate_intersection:nnnnnn`.)

95.6 Affine transformations

```

\l__coffin_sin_fp Used for rotations to get the sine and cosine values.
\l__coffin_cos_fp
36502 \fp_new:N \l__coffin_sin_fp
36503 \fp_new:N \l__coffin_cos_fp

```

(End of definition for `\l__coffin_sin_fp` and `\l__coffin_cos_fp`.)

`\l__coffin_bounding_prop` A property list for the bounding box of a coffin. This is only needed during the rotation, so there is just the one.

```
36504 \prop_new:N \l__coffin_bounding_prop
```

(End of definition for `\l__coffin_bounding_prop`.)

`\l__coffin_corners_prop` Used to avoid needing to track scope for intermediate steps.

```
\l__coffin_poles_prop 36505 \prop_new:N \l__coffin_corners_prop
```

```
36506 \prop_new:N \l__coffin_poles_prop
```

(End of definition for `\l__coffin_corners_prop` and `\l__coffin_poles_prop`.)

`\l__coffin_bounding_shift_dim` The shift of the bounding box of a coffin from the real content.

```
36507 \dim_new:N \l__coffin_bounding_shift_dim
```

(End of definition for `\l__coffin_bounding_shift_dim`.)

`\l__coffin_left_corner_dim` These are used to hold maxima for the various corner values: these thus define the minimum size of the bounding box after rotation.

`\l__coffin_right_corner_dim`

`\l__coffin_bottom_corner_dim`

```
36508 \dim_new:N \l__coffin_left_corner_dim
```

```
36509 \dim_new:N \l__coffin_right_corner_dim
```

```
36510 \dim_new:N \l__coffin_bottom_corner_dim
```

```
36511 \dim_new:N \l__coffin_top_corner_dim
```

(End of definition for `\l__coffin_left_corner_dim` and others.)

`\coffin_rotate:Nn` Rotating a coffin requires several steps which can be conveniently run together. The sine and cosine of the angle in degrees are computed. This is then used to set `\l__coffin_sin_fp` and `\l__coffin_cos_fp`, which are carried through unchanged for the rest of the procedure.

`\coffin_rotate:cn`

`\coffin_grotate:Nn`

`\coffin_grotate:cn`

`__coffin_rotate:NnNNN`

```
36512 \cs_new_protected:Npn \coffin_rotate:Nn #1#2
```

```
36513 { \__coffin_rotate:NnNNN #1 {#2} \box_rotate:Nn \prop_set_eq:cN \hbox_set:Nn }
```

```
36514 \cs_generate_variant:Nn \coffin_rotate:Nn { c }
```

```
36515 \cs_new_protected:Npn \coffin_grotate:Nn #1#2
```

```
36516 { \__coffin_rotate:NnNNN #1 {#2} \box_grotate:Nn \prop_gset_eq:cN \hbox_gset:Nn }
```

```
36517 \cs_generate_variant:Nn \coffin_grotate:Nn { c }
```

```
36518 \cs_new_protected:Npn \__coffin_rotate:NnNNN #1#2#3#4#5
```

```
36519 {
```

```
36520 \fp_set:Nn \l__coffin_sin_fp { sind ( #2 ) }
```

```
36521 \fp_set:Nn \l__coffin_cos_fp { cosd ( #2 ) }
```

Use a local copy of the property lists to avoid needing to pass the name and scope around.

```
36522 \prop_set_eq:Nc \l__coffin_corners_prop
```

```
36523 { coffin ~ \__coffin_to_value:N #1 ~ corners }
```

```
36524 \prop_set_eq:Nc \l__coffin_poles_prop
```

```
36525 { coffin ~ \__coffin_to_value:N #1 ~ poles }
```

The corners and poles of the coffin can now be rotated around the origin. This is best achieved using mapping functions.

```
36526 \prop_map_inline:Nn \l__coffin_corners_prop
```

```
36527 { \__coffin_rotate_corner:Nnnn #1 {##1} ##2 }
```

```
36528 \prop_map_inline:Nn \l__coffin_poles_prop
```

```
36529 { \__coffin_rotate_pole:Nnnnnn #1 {##1} ##2 }
```

The bounding box of the coffin needs to be rotated, and to do this the corners have to be found first. They are then rotated in the same way as the corners of the coffin material itself.

```

36530     \__coffin_set_bounding:N #1
36531     \prop_map_inline:Nn \l__coffin_bounding_prop
36532     { \__coffin_rotate_bounding:nnn {##1} ##2 }

```

At this stage, there needs to be a calculation to find where the corners of the content and the box itself will end up.

```

36533     \__coffin_find_corner_maxima:N #1
36534     \__coffin_find_bounding_shift:
36535     #3 #1 {#2}

```

The correction of the box position itself takes place here. The idea is that the bounding box for a coffin is tight up to the content, and has the reference point at the bottom-left. The x -direction is handled by moving the content by the difference in the positions of the bounding box and the content left edge. The y -direction is dealt with by moving the box down by any depth it has acquired. The internal box is used here to allow for the next step.

```

36536     \hbox_set:Nn \l__coffin_internal_box
36537     {
36538         \__kernel_kern:n
36539         { \l__coffin_bounding_shift_dim - \l__coffin_left_corner_dim }
36540         \box_move_down:nn { \l__coffin_bottom_corner_dim }
36541         { \box_use:N #1 }
36542     }

```

If there have been any previous rotations then the size of the bounding box will be bigger than the contents. This can be corrected easily by setting the size of the box to the height and width of the content. As this operation requires setting box dimensions and these transcend grouping, the safe way to do this is to use the internal box and to reset the result into the target box.

```

36543     \box_set_ht:Nn \l__coffin_internal_box
36544     { \l__coffin_top_corner_dim - \l__coffin_bottom_corner_dim }
36545     \box_set_dp:Nn \l__coffin_internal_box { 0pt }
36546     \box_set_wd:Nn \l__coffin_internal_box
36547     { \l__coffin_right_corner_dim - \l__coffin_left_corner_dim }
36548     #5 #1 { \box_use_drop:N \l__coffin_internal_box }

```

The final task is to move the poles and corners such that they are back in alignment with the box reference point.

```

36549     \prop_map_inline:Nn \l__coffin_corners_prop
36550     { \__coffin_shift_corner:Nnnn #1 {##1} ##2 }
36551     \prop_map_inline:Nn \l__coffin_poles_prop
36552     { \__coffin_shift_pole:Nnnnnn #1 {##1} ##2 }

```

Update the coffin data.

```

36553     #4 { coffin ~ \__coffin_to_value:N #1 ~ corners }
36554     \l__coffin_corners_prop
36555     #4 { coffin ~ \__coffin_to_value:N #1 ~ poles }
36556     \l__coffin_poles_prop
36557 }

```

(End of definition for \coffin_rotate:Nn, \coffin_grotate:Nn, and __coffin_rotate:NnNNN. These functions are documented on page 325.)

_coffin_set_bounding:N The bounding box corners for a coffin are easy enough to find: this is the same code as for the corners of the material itself, but using a dedicated property list.

```

36558 \cs_new_protected:Npn \_coffin_set_bounding:N #1
36559 {
36560   \prop_put:Nne \l__coffin_bounding_prop { tl }
36561   { { Opt } { \dim_eval:n { \box_ht:N #1 } } }

36592   \l__coffin_x_prime_dim \l__coffin_y_prime_dim
36593   \prop_put:Nne \l__coffin_poles_prop {#2}
36594   {
36595     { \dim_use:N \l__coffin_x_dim } { \dim_use:N \l__coffin_y_dim }
36596     { \dim_use:N \l__coffin_x_prime_dim }
36597     { \dim_use:N \l__coffin_y_prime_dim }
36598   }
36599 }

```

(End of definition for `__coffin_rotate_pole:Nnnnnn`.)

`__coffin_rotate_vector:nnNN` A rotation function, which needs only an input vector (as dimensions) and an output space. The values `\l__coffin_cos_fp` and `\l__coffin_sin_fp` should previously have been set up correctly. Working this way means that the floating point work is kept to a minimum: for any given rotation the sin and cosine values do no change, after all.

```

36600 \cs_new_protected:Npn \__coffin_rotate_vector:nnNN #1#2#3#4
36601 {
36602   \dim_set:Nn #3
36603   {
36604     \fp_to_dim:n
36605     {
36606       \dim_to_fp:n {#1} * \l__coffin_cos_fp
36607       - \dim_to_fp:n {#2} * \l__coffin_sin_fp
36608     }
36609   }
36610   \dim_set:Nn #4
36611   {
36612     \fp_to_dim:n
36613     {
36614       \dim_to_fp:n {#1} * \l__coffin_sin_fp
36615       + \dim_to_fp:n {#2} * \l__coffin_cos_fp
36616     }
36617   }
36618 }

```

(End of definition for `__coffin_rotate_vector:nnNN`.)

`_coffin_find_corner_maxima:N`
`_coffin_find_corner_maxima_aux:nn` The idea here is to find the extremities of the content of the coffin. This is done by looking for the smallest values for the bottom and left corners, and the largest values for the top and right corners. The values start at the maximum dimensions so that the case where all are positive or all are negative works out correctly.

```

36619 \cs_new_protected:Npn \__coffin_find_corner_maxima:N #1
36620 {
36621   \dim_set:Nn \l__coffin_top_corner_dim { -\c_max_dim }

95.7 Aligning and typesetting of coffins

\coffin_join:NnnNnnnn

\coffin_join:cnNnnnnn

\coffin_join:Nnnncnnnn

\coffin_join:cnncnnnn

\coffin_gjoin:NnnNnnnn

\coffin_gjoin:cnNnnnnn

\coffin_gjoin:Nnnncnnnn

\coffin_gjoin:cnncnnnn

__coffin_join:NnnNnnnnN

This command joins two coffins, using a horizontal and vertical pole from each coffin and making an offset between the two. The result is stored as the as a third coffin, which has all of its handles reset to standard values. First, the more basic alignment function is used to get things started.

```

36777   \cs_new_protected:Npn \coffin_join:NnnNnnnn #1#2#3#4#5#6#7#8
36778   {
36779     \__coffin_join:NnnNnnnnN #1 {#2} {#3} #4 {#5} {#6} {#7} {#8}
36780     \coffin_set_eq:NN
36781   }
36782   \cs_generate_variant:Nn \coffin_join:NnnNnnnn { c , Nnnc , cnnc }
36783   \cs_new_protected:Npn \coffin_gjoin:NnnNnnnn #1#2#3#4#5#6#7#8

36785     \__coffin_join:NnnNnnnnN #1 {#2} {#3} #4 {#5} {#6} {#7} {#8}
36786     \coffin_gset_eq:NN
36787   }

```

```

36788 \cs_generate_variant:Nn \coffin_gjoin:NnnNnnnn { c , Nnnc , cnnc }
36789 \cs_new_protected:Npn \__coffin_join:NnnNnnnnN #1#2#3#4#5#6#7#8#9
36790 {
36791   \__coffin_align:NnnNnnnnN
36792   #1 {#2} {#3} #4 {#5} {#6} {#7} {#8} \l__coffin_aligned_coffin

```

Correct the placement of the reference point. If the x -offset is negative then the reference point of the second box is to the left of that of the first, which is corrected using a kern. On the right side the first box might stick out, which would show up if it is wider than the sum of the x -offset and the width of the second box. So a second kern may be needed.

```

36793   \hbox_set:Nn \l__coffin_aligned_coffin
36794   {
36795     \dim_compare:nNnT { \l__coffin_offset_x_dim } < \c_zero_dim
36796     { \__kernel_kern:n { -\l__coffin_offset_x_dim } }

```

A more simple version of the above, as it simply uses the size of the first coffin for the new one. This means that the work here is rather simplified compared to the above code. The function used when marking a position is hear also as it is similar but without the structure updates.

(End of definition for \coffin_attach:NnnNnnnn and others. These functions are documented on page 326.)

__coffin_align:NnnNnnnnN The internal function aligns the two coffins into a third one, but performs no corrections on the resulting coffin poles. The process begins by finding the points of intersection for the poles for each of the input coffins. Those for the first coffin are worked out after those for the second coffin, as this allows the ‘primed’ storage area to be used for the

second coffin. The ‘real’ box offsets are then calculated, before using these to re-box the input coffins. The default poles are then set up, but the final result depends on how the bounding box is being handled.

```

36870 \cs_new_protected:Npn \__coffin_align:NnnNnnnnN #1#2#3#4#5#6#7#8#9
36871 {

36888 }

```

(End of definition for __coffin_align:NnnNnnnnN.)

__coffin_offset_poles:Nnn
 __coffin_offset_pole:Nnnnnnn

Transferring structures from one coffin to another requires that the positions are updated by the offset between the two coffins. This is done by mapping over the property list of the source coffins, moving as appropriate and saving to the new coffin data structures. The test for a - means that the structures from the parent coffins are uniquely labelled and do not depend on the order of alignment. The pay off for this is that - should not be used in coffin pole or handle names, and that multiple alignments do not result in a whole set of values.

```

36889 \cs_new_protected:Npn \__coffin_offset_poles:Nnn #1#2#3
36890 {
36891   \prop_map_inline:cn { coffin ~ \__coffin_to_value:N #1 ~ poles }
36892     { \__coffin_offset_pole:Nnnnnnn #1 {##1} ##2 {#2} {#3} }
36893 }
36894 \cs_new_protected:Npn \__coffin_offset_pole:Nnnnnnn #1#2#3#4#5#6#7#8

```

(End of definition for \l__coffin_display_handles_prop.)

`\l__coffin_display_offset_dim` The standard offset for the label from the handle position when displaying handles.

```

37011 \dim_new:N \l__coffin_display_offset_dim
37012 \dim_set:Nn \l__coffin_display_offset_dim { 2pt }

```

(End of definition for \l__coffin_display_offset_dim.)

`\l__coffin_display_x_dim` As the intersections of poles have to be calculated to find which ones to print, there is
`\l__coffin_display_y_dim` a need to avoid repetition. This is done by saving the intersection into two dedicated
values.

```

37013 \dim_new:N \l__coffin_display_x_dim
37014 \dim_new:N \l__coffin_display_y_dim

```

(End of definition for \l__coffin_display_x_dim and \l__coffin_display_y_dim.)

`\l__coffin_display_poles_prop` A property list for printing poles: various things need to be deleted from this to get a
“nice” output.

```

37015 \prop_new:N \l__coffin_display_poles_prop

```

(End of definition for \l__coffin_display_poles_prop.)

`\l__coffin_display_font_tl` Stores the settings used to print coffin data: this keeps things flexible.

```

37016 \tl_new:N \l__coffin_display_font_tl
37017 \bool_lazy_and:nnT
37018 { \cs_if_exist_p:N \fmtname }
37019 { \str_if_eq_p:Vn \fmtname { LaTeX2e } }
37020 {

```

```

37021 \tl_set:Nn \l__coffin_display_font_tl
37022 { \sffamily \tiny }
37023 }

```

(End of definition for \l__coffin_display_font_tl.)

__coffin_rule:nn Abstract out creation of rules here until there is a higher-level interface.

```

37024 \cs_new_protected:Npn \__coffin_rule:nn #1#2
37025 {
37026   \mode_leave_vertical:
37027   \hbox:n { \tex_vrule:D width #1 height #2 \scan_stop: }
37028 }

```

(End of definition for __coffin_rule:nn.)

\coffin_mark_handle:Nnnn Marking a single handle is relatively easy. The standard attachment function is used, meaning that there are two calculations for the location. However, this is likely to be okay given the load expected. Contrast with the more optimised version for showing all handles which comes next.

\coffin_mark_handle:cnnn

Chapter 96

l3color implementation

```
37241 <*code>
37242 <@@=color>
```

96.1 Basics

`\l__color_current_tl` The color currently active for foreground (text, etc.) material. This is stored in the form of a color model followed by one or more values. There are four pre-defined models, three of which take numerical values in the range [0, 1]:

- `gray` `<gray>` Grayscale color with the `<gray>` value running from 0 (fully black) to 1 (fully white)
- `cmYk` `<cyan>` `<magenta>` `<yellow>` `<black>`
- `rgb` `<red>` `<green>` `<blue>`

Notice that the value are separated by spaces. There is a fourth pre-defined model using a string value and a numerical one:

- `spot` `<name>` `<tint>` A pre-defined spot color, where the `<name>` should be a pre-defined string color name and the `<tint>` should be in the range [0, 1].

Additional models may be created to allow mixing of spot colors. The number of data entries these require will depend on the number of colors to be mixed.

TeXhackers note: The content of `\l__color_current_tl` comprises two brace groups, the first containing the color model and the second containing the value(s) applicable in that model.

(End of definition for \l__color_current_tl.)

`\color_group_begin:` Grouping for color is the same as using the basic `\group_begin:` and `\group_end:` functions. However, for semantic reasons, they are renamed here.

```
37243 \cs_new_eq:NN \color_group_begin: \group_begin:
37244 \cs_new_eq:NN \color_group_end: \group_end:
```

(End of definition for \color_group_begin: and \color_group_end:. These functions are documented on page 329.)

\color_ensure_current: A driver-independent wrapper for setting the foreground color to the current color “now”.

```
37245 \cs_new_protected:Npn \color_ensure_current:
37246 { \__color_select:N \l__color_current_tl }
```

(End of definition for \color_ensure_current:. This function is documented on page 329.)

\s__color_stop Internal scan marks.

```
37247 \scan_new:N \s__color_stop
```

(End of definition for \s__color_stop.)

__color_select:N Take an internal color specification and pass it to the driver. This code is needed to ensure the current color but will also be used by the higher-level material.

__color_select_math:N

__color_select:nn

```
37248 \cs_new_protected:Npn \__color_select:N #1
37249 {
37250   \exp_after:wN \__color_select:nn #1
37251   \group_insert_after:N \__color_backend_reset:
37252 }
37253 \cs_new_protected:Npn \__color_select_math:N #1
37254 { \exp_after:wN \__color_select:nn #1 }
37255 \cs_new_protected:Npn \__color_select:nn #1#2
37256 { \use:c { __color_backend_select_ #1 :n } {#2} }
```

(End of definition for __color_select:N, __color_select_math:N, and __color_select:nn.)

\l__color_current_tl The current color, with the model and

```
37257 \tl_new:N \l__color_current_tl
37258 \tl_set:Nn \l__color_current_tl { { gray } { 0 } }
```

(End of definition for \l__color_current_tl.)

96.2 Predefined color names

The ability to predefine colors with a name is a key part of this module and means there has to be a method for storing the results. At first sight, it seems natural to follow the usual `expl3` model and create a `color` variable type for the process. That would then allow both local and global colors, constant colors and the like. However, these names need to be accessible in some form at the user level, for selection of colors either simply by name or as part of a more complex expression. This does not require that the full name is exposed but does require that they can be looked up in a predictable way. As such, it is more useful to expose just the color names as part of the interface, with the result that only local color names can be created. (This is also seen for example in key creation in `l3keys`.) As a result, color names are declarative (no `new` functions).

Since there is no need to manipulate colors *en masse*, each is stored in a two-part structure: a `prop` for the colors themselves, and a `tl` for the default model for each color.

96.3 Setup

```

\l__color_internal_int
\l__color_internal_tl
37259 \int_new:N \l__color_internal_int
37260 \tl_new:N \l__color_internal_tl

(End of definition for \l__color_internal_int and \l__color_internal_tl.)

\s__color_mark Internal scan marks. \s__color_stop is already defined in l3color-base.
37261 \scan_new:N \s__color_mark

(End of definition for \s__color_mark.)

\l__color_ignore_error_bool Used to avoid issuing multiple errors if there is a change-of-model with input container
an error.
37262 \bool_new:N \l__color_ignore_error_bool

(End of definition for \l__color_ignore_error_bool.)

```

96.4 Utility functions

\color_if_exist_p:n A simple wrapper to avoid needing to have the lookup repeated in too many places. To guard against a color created in a group, we need to test for entries in the `prop`.

\color_if_exist:nTF

```

37263 \prg_new_conditional:Npnn \color_if_exist:n #1 { p , T, F, TF }
37264 {
37265   \prop_if_exist:cTF { l__color_named_ #1 _prop }
37266   {
37267     \prop_if_empty:cTF { l__color_named_ #1 _prop }
37268     \prg_return_false:
37269     \prg_return_true:
37270   }
37271   \prg_return_false:
37272 }

```

(End of definition for \color_if_exist:nTF. This function is documented on page [332](#).)

__color_model:N Simple abstractions.

```

\__color_values:N
37273 \cs_new:Npn \__color_model:N #1 { \exp_after:wN \use_i:nn #1 }
37274 \cs_new:Npn \__color_values:N #1 { \exp_after:wN \use_ii:nn #1 }

```

(End of definition for __color_model:N and __color_values:N.)

__color_extract:nNN Recover the values for the standard model for a color.

```

\__color_extract:VNN
37275 \cs_new_protected:Npn \__color_extract:nNN #1#2#3
37276 {
37277   \tl_set_eq:Nc #2 { l__color_named_ #1 _tl }
37278   \prop_get:cVN { l__color_named_ #1 _prop } #2 #3
37279 }
37280 \cs_generate_variant:Nn \__color_extract:nNN { V }

```

(End of definition for __color_extract:nNN.)

96.5 Model conversion

Model conversion is carried out using standard formulae for base models, as described in the manual for xcolor (see also the *PostScript Language Reference Manual*). For other models direct conversion might not be defined, so we go through the fallback models if necessary.

```

__color_convert:nnN
__color_convert:VVN
__color_convert:nnnN
__color_convert:nVnN
__color_convert:nnVN
37281 \cs_new_protected:Npn \__color_convert:nnN #1#2#3
37282 { \__color_convert:nnVN {#1} {#2} #3 #3 }
37283 \cs_generate_variant:Nn \__color_convert:nnN { VV }
37284 \cs_generate_variant:Nn \exp_last_unbraced:Nf { c }
37285 \cs_new_protected:Npn \__color_convert:nnnN #1#2#3#4
37286 {
37287   \tl_set:Nc #4
37288   {
37289     \cs_if_exist_use:CTF { __color_convert_ #1 _ #2 :w }
37290     { #3 \s__color_stop }
37291     {
37292       \cs_if_exist:CTF { __color_convert_ \use:c { c__color_fallback_ #1 _tl } _ #2 :
37293       {
37294         \exp_last_unbraced:cf
37295         { __color_convert_ \use:c { c__color_fallback_ #1 _tl } _ #2 :w }
37296         { \use:c { __color_convert_ #1 _ \use:c { c__color_fallback_ #1 _tl } :w
37297         \s__color_stop
37298       }
37299     }
37300     \exp_last_unbraced:cf
37301     { __color_convert_ \use:c { c__color_fallback_ #2 _tl } _ #2 :w }
37302     {
37303       \cs_if_exist_use:CTF { __color_convert_ #1 _ \use:c { c__color_fallback
37304       { #3 \s__color_stop }
37305       {
37306         \exp_last_unbraced:cf
37307         { __color_convert_ \use:c { c__color_fallback_ #1 _tl } _ \use:c
37308         { \use:c { __color_convert_ #1 _ \use:c { c__color_fallback_ #1 _
37309         \s__color_stop
37310       }
37311     }
37312     \s__color_stop
37313   }
37314 }
37315 }
37316 }
37317 \cs_generate_variant:Nn \__color_convert:nnnN { nV , nnV }
37318 \cs_new:Npn \__color_convert_gray_gray:w #1 \s__color_stop
37319 { #1 }
37320 \cs_new:Npn \__color_convert_gray_rgb:w #1 \s__color_stop
37321 { #1 ~ #1 ~ #1 }
37322 \cs_new:Npn \__color_convert_gray_cmyk:w #1 \s__color_stop
37323 { 0 ~ 0 ~ 0 ~ \fp_eval:n { 1 - #1 } }

These rather odd values are based on NTSC television: the set are used for the cmyk
conversion.
37324 \cs_new:Npn \__color_convert_rgb_gray:w #1 ~ #2 ~ #3 \s__color_stop
37325 { \fp_eval:n { 0.3 * #1 + 0.59 * #2 + 0.11 * #3 } }

```

```

37326 \cs_new:Npn \__color_convert_rgb_rgb:w #1 \s__color_stop
37327 { #1 }

```

The conversion from `rgb` to `cmk` is the most complex: a two-step procedure which requires *black generation* and *undercolor removal* functions. The PostScript reference describes them as device-dependent, but following `xcolor` we assume they are linear. Moreover, as the likelihood of anyone using a non-unitary matrix here is tiny, we simplify and treat those two concepts as no-ops. To allow code sharing with parsing of `cmk` values, we have an intermediate function here (`__color_convert_rgb_cmyk:nnn`) which actually takes `cmk` values as input.

```

37328 \cs_new:Npn \__color_convert_rgb_cmyk:w #1 ~ #2 ~ #3 \s__color_stop
37329 {
37330   \exp_args:Neee \__color_convert_rgb_cmyk:nnn
37331   { \fp_eval:n { 1 - #1 } }
37332   { \fp_eval:n { 1 - #2 } }
37333   { \fp_eval:n { 1 - #3 } }
37334 }
37335 \cs_new:Npn \__color_convert_rgb_cmyk:nnn #1#2#3
37336 {
37337   \exp_args:Ne \__color_convert_rgb_cmyk:nnnn
37338   { \fp_eval:n { min ( #1 , #2 , #3 ) } } {#1} {#2} {#3}
37339 }
37340 \cs_new:Npn \__color_convert_rgb_cmyk:nnnn #1#2#3#4
37341 {
37342   \fp_eval:n { min ( 1 , max ( 0 , #2 - #1 ) ) } \c_space_tl
37343   \fp_eval:n { min ( 1 , max ( 0 , #3 - #1 ) ) } \c_space_tl
37344   \fp_eval:n { min ( 1 , max ( 0 , #4 - #1 ) ) } \c_space_tl
37345   #1
37346 }
37347 \cs_new:Npn \__color_convert_cmyk_gray:w #1 ~ #2 ~ #3 ~ #4 \s__color_stop
37348 { \fp_eval:n { 1 - min ( 1 , 0.3 * #1 + 0.59 * #2 + 0.11 * #3 + #4 ) } }
37349 \cs_new:Npn \__color_convert_cmyk_rgb:w #1 ~ #2 ~ #3 ~ #4 \s__color_stop

37353   \fp_eval:n { 1 - min ( 1 , #3 + #4 ) }
37354 }
37355 \cs_new:Npn \__color_convert_cmyk_cmyk:w #1 \s__color_stop
37356 { #1 }

```

(End of definition for `__color_convert:nnN` and others.)

96.6 Color expressions

```

\l__color_model_tl Working space to store the color data whilst doing calculations: keeping it on the stack
\l__color_value_tl is attractive but gets tricky (return is non-trivial).
\l__color_next_model_tl
\l__color_next_value_tl
37357 \tl_new:N \l__color_model_tl
37358 \tl_new:N \l__color_value_tl
37359 \tl_new:N \l__color_next_model_tl
37360 \tl_new:N \l__color_next_value_tl

```

(End of definition for `\l__color_model_tl` and others.)

```

    \__color_parse:nN
    \__color_parse_aux:nN
    \__color_parse_eq:Nn
    \__color_parse_eq:nNn
    \__color_parse:Nw
    \__color_parse_loop_init:Nnn
    \__color_parse_loop:w
    \__color_parse_loop_check:nn
    \__color_parse_loop:nn
    \__color_parse_gray:n
    \__color_parse_std:n
    \__color_parse_break:w
    \__color_parse_end:
    \__color_parse_mix:Nnnn
    \__color_parse_mix:NVVn
    \__color_parse_mix:nNnn
    \__color_parse_mix_gray:nw
    \__color_parse_mix_rgb:nw
    \__color_parse_mix_cmyk:nw

```

The main function for parsing color expressions removes actives but otherwise expands, then starts working through the expression itself. At the end, we apply the payload.

```

37361 \cs_new_protected:Npe \__color_parse:nN #1#2
37362 {
37363     \tl_set:Nc \exp_not:c { l__color_named_ . _tl }
37364     { \exp_not:N \__color_model:N \exp_not:N \l__color_current_tl }
37365     \prop_put:Nve \exp_not:c { l__color_named_ . _prop }
37366     \exp_not:c { l__color_named_ . _tl }
37367     { \exp_not:N \__color_values:N \exp_not:N \l__color_current_tl }
37368     \exp_not:N \exp_args:Nc \exp_not:N \__color_parse_aux:nN
37369     { \exp_not:N \tl_to_str:n {#1} } #2
37370 }

```

Before going to all of the effort of parsing an expression, these two precursor functions look for a pre-defined name, either on its own or with a trailing ! (which is the same thing).

```

37371 \cs_new_protected:Npn \__color_parse_aux:nN #1#2
37372 {
37373     \color_if_exist:nTF {#1}
37374     { \__color_parse_set_eq:Nn #2 {#1} }
37375     { \__color_parse:Nw #2#1 ! \s__color_stop }
37376     \__color_check_model:N #2
37377 }
37378 \cs_new_protected:Npn \__color_parse_set_eq:Nn #1#2
37379 {
37380     \tl_if_empty:NTF \l_color_fixed_model_tl
37381     { \exp_args:Nv \__color_parse_set_eq:nNn { l__color_named_ #2 _tl } }
37382     { \exp_args:Nv \__color_parse_set_eq:nNn \l_color_fixed_model_tl }
37383     #1 {#2}
37384 }

```

Here, we have to allow for the case where there is a fixed model: that can't be swept up by generic conversion as we are dealing with a named color.

```

37385 \cs_new_protected:Npn \__color_parse_set_eq:nNn #1#2#3
37386 {
37387     \prop_get:cnNTF
37388     { l__color_named_ #3 _prop } {#1}
37389     \l__color_value_tl
37390     { \tl_set:Nc #2 { {#1} { \l__color_value_tl } } }
37391     {
37392         \tl_set_eq:Nc \l__color_model_tl { l__color_named_ #3 _tl }
37393         \prop_get:cVN { l__color_named_ #3 _prop } \l__color_model_tl
37394         \l__color_value_tl
37395         \__color_convert:nnN
37396         \l__color_model_tl {#1} \l__color_value_tl
37397         \tl_set:Nc #2
37398         {
37399             {#1}
37400             { \l__color_value_tl }
37401         }
37402     }
37403 }
37404 \cs_new_protected:Npn \__color_parse:Nw #1#2 ! #3 \s__color_stop
37405 {

```

```

37406 \color_if_exist:nTF {#2}
37407 {
37408   \tl_if_blank:nTF {#3}
37409   { \__color_parse_set_eq:Nn #1 {#2} }
37410   { \__color_parse_loop_init:Nnn #1 {#2} {#3} }
37411 }
37412 {
37413   \msg_error:nnn { color } { unknown-color } {#2}
37414   \tl_set:Nn \l__color_current_tl { { gray } { 0 } }
37415 }
37416 }

```

Once we establish that a full parse is needed, the next job is to get the detail of the first color. That will determine the model we use for the calculation: splitting here makes checking that a bit easier.

```

37417 \cs_new_protected:Npn \__color_parse_loop_init:Nnn #1#2#3
37418 {
37419   \group_begin:
37420   \__color_extract:nnn {#2} \l__color_model_tl \l__color_value_tl
37421   \__color_parse_loop:w #3 ! ! ! \s__color_stop
37422   \tl_set:Nc \l__color_internal_tl
37423   { { \l__color_model_tl } { \l__color_value_tl } }
37424   \exp_args:NNNV \group_end:
37425   \tl_set:Nn #1 \l__color_internal_tl
37426 }

```

This is the loop proper: there can be an open-ended set of colors to parse, separated by ! tokens. There are a few cases to look out for. At the end of the expression and with we find a mix of 100 then we simply skip the next color entirely (we can't stop the loop as there might be a further valid color to mix in). On the other hand, if we get a mix of 0 then drop everything so far and start again. There is also a trailing `white` to “read in” if the final explicit data is a mix. Those conditions are separate from actually looping, which is therefore sorted out by checking if we have further data to process: in contrast to `xcolor`, we don't allow !! so the test can be simplified.

```

37427 \cs_new_protected:Npn \__color_parse_loop:w #1 ! #2 ! #3 ! #4 ! #5 \s__color_stop
37428 {
37429   \tl_if_blank:nF {#1}

37461     \l__color_model_tl \l__color_value_tl
37462   }
37463 }

```

The “payload” of calculation in the loop first. If the model for the upcoming color is different from that of the existing (partial) color, convert the model. For **gray** the two are flipped round so that the outcome is something with “real” color. We are then in a position to do the actual calculation itself. The two auxiliaries here give us a way to break the loop should an invalid name be found.

```

37464 \cs_new_protected:Npn \__color_parse_loop:nn #1#2
37465 {
37466   \color_if_exist:nTF {#2}
37467   {

37704   }

```

(End of definition for __color_parse_model_cmy:w.)

__color_parse_model_tHsb:w There are three stages to the process here: bring the tH argument into the normal range, divide through to get to hsb and finally convert that to rgb. The final stage can be delegated to the parsing function for hsb, and the conversion from Hsb to hsb is trivial, so the main focus here is the first stage. We use a simple expandable loop to do the work, and we implement the equation given in the xcolor manual (number 85 there) as a simple expression.

```

(End of definition for `\color_select:n` and others. These functions are documented on page 332.)

96.8 Math color

The approach here is the same as for the $\text{\LaTeX} 2_{\epsilon}$ `\mathcolor` command, but as we are working at the `expl3` level we can make some minor changes.

`\l_color_math_active_tl` Tokens representing active sub/superscripts.

```

37822 \tl_new:N \l_color_math_active_tl
37823 \tl_set:Nn \l_color_math_active_tl { ' }

```

(End of definition for `\l_color_math_active_tl`. This function is documented on page 333.)

`\g__color_math_seq` Not all engines have multiple color stacks, and at the same time we are not expecting breaking within a colored math fragment. So we track the color stack ourselves.

```

37824 \seq_new:N \g__color_math_seq

```

(End of definition for `\g__color_math_seq`.)

`\color_math:nn` The basic set up here is relatively simple: store the current color, parse the new color
`\color_math:nnn` as-normal, then switch color before inserting the tokens we are asked to change. The
`__color_math:nn` tricky part is right at the end, handling the reset.

```

37825 \cs_new_protected:Npn \color_math:nn #1#2
37826 {
37827   \__color_math:nn {#2}
37828   { \__color_parse:nN {#1} \l__color_current_tl }
37829 }
37830 \cs_new_protected:Npn \color_math:nnn #1#2#3
37831 {
37832   \__color_math:nn {#3}
37833   { \__color_select_main:Nnn \l__color_current_tl {#1} {#2} }
37834 }
37835 \cs_new_protected:Npn \__color_math:nn #1#2
37836 {
37837   \seq_gpush:NV \g__color_math_seq \l__color_current_tl

```

```

37838     #2
37839     \_color_select_math:N \l__color_current_tl
37840     #1
37841     \_color_math_scan:w
37842 }

```

(End of definition for `\color_math:nn`, `\color_math:nnn`, and `_color_math:nn`. These functions are documented on page 333.)

```

\_color_math_scan:w
\_color_math_scan_auxi:
\_color_math_scan_auxii:
\_color_math_scan_end:

```

The complication when changing the color back is due to the fact that the `\color_math:nn(n)` may be followed by `^` or `_` or the hidden superscript (for example `'`) and its argument may end in a `\mathop` in which case the sub- and superscripts may be attached as `\limits` instead of after the material. All cases need separate treatment. To avoid repeatedly collecting the same token, we first check for an alignment tab: assuming we don't have one of those, we can “recycle” `\l_peek_token` safely. As we have an explicit `\c_alignment_token`, there needs to be an align-safe group present.

```

37843 \cs_new_protected:Npn \_color_math_scan:w
37844 {
37845   \peek_remove_filler:n
37846   {
37847     \group_align_safe_begin:
37848     \peek_catcode:NTF \c_alignment_token
37849     {
37850       \group_align_safe_end:
37851       \_color_math_scan_end:
37852     }
37853     {
37854       \group_align_safe_end:
37855       \_color_math_scan_auxi:
37856     }
37857   }
37858 }

```

Dealing with literal `_` and `^` is easy, and as we have exactly two cases, we can hard-code this. We use a hard-coded list for limits: these are all primitives. The `\use_none:n` here also removes the test token so it is left just in the right place.

```

37859 \cs_new_protected:Npn \_color_math_scan_auxi:
37860 {
37861   \token_case_catcode:NnTF \l_peek_token
37862   {
37863     \c_math_subscript_token { }
37864     \c_math_superscript_token { }
37865   }
37866   { \_color_math_scripts:Nw }
37867   {
37868     \token_case_meaning:NnTF \l_peek_token
37869     {
37870       \tex_limits:D { \tex_limits:D }
37871       \tex_nolimits:D { \tex_nolimits:D }
37872       \tex_displaylimits:D { \tex_displaylimits:D }
37873     }
37874     { \_color_math_scan:w \use_none:n }
37875     { \_color_math_scan_auxii: }
37876   }
37877 }

```

The one final case to handle is math-active tokens, most obviously ‘, as these won’t be covered earlier.

```

37878 \cs_new_protected:Npn \__color_math_scan_auxii:

37902 }

```

(End of definition for __color_math_scan:w and others.)

__color_math_scripts:Nw
 __color_math_script_aux:N

The tricky part of handling sub and superscripts is that we have to reset color to the one that is on the stack but reset it back to what it was before to allow for cases like

$$\backslash [\backslash color_math:n \{ red \} \{ a + \sum \} _ \{ i = 1 \} ^ \{ n \} \backslash]$$

Here, T_EX constructs a \vbox stacking subscript, summation sign, and superscript. So technically the superscript comes first and the \sum that should get colored red is the middle.

The approach here is to set up a brace group immediately after the script token, then to set the color appropriately in that argument. We need an extra group to keep the color contained, and as we need to allow for an explicit closing brace in the source, the inner group also is a brace one rather than \group_begin:-based. At the end of the outer group we need to insert __color_math_scan:w to continue the search for a second script token.

Notice that here we *don’t* need to use the math-specific color selector as we can allow the \group_insert_after:N \@@_backend_reset: to operate normally.

```

37903 \cs_new_protected:Npn \__color_math_scripts:Nw #1
37904 {
37905   #1
37906   \c_group_begin_token
37907   \c_group_begin_token
37908   \seq_get:NN \g__color_math_seq \l__color_current_tl
37909   \__color_select:N \l__color_current_tl

```

```

37910         \group_insert_after:N \c_group_end_token
37911         \group_insert_after:N \_color_math_scan:w
37912     \peek_remove_filler:n
37913     {
37914         \peek_catcode_remove:NF \c_group_begin_token
37915         { \_color_math_script_aux:N }
37916     }
37917 }

```

Deal with the case where we do not have an explicit brace pair in the source.

```

37918 \cs_new_protected:Npn \_color_math_script_aux:N #1 { #1 \c_group_end_token }

```

(End of definition for `_color_math_scripts:Nw` and `_color_math_script_aux:N`.)

96.9 Fill and stroke color

```

\color_fill:n
\color_stroke:n
\color_fill:nn

37943 }

```

(End of definition for `\color_fill:n` and others. These functions are documented on page 333.)

96.10 Defining named colors

`\l__color_named_tl` Space to store the detail of the named color.

```

37944 \tl_new:N \l__color_named_tl

```

(End of definition for `\l__color_named_tl`.)

```

\color_set:nn Defining named colors means working through the model list and saving both the “main”
\__color_set:nnn color and any equivalents in other models. Even if there is only one model, we store a
\__color_set:nn prop as well as a t1, as there could be grouping weirdness, etc. When setting using an
\__color_set:nnw expression, we need to avoid any fixed model issues, which is done without a group as in
\color_set:nnn l3keys.
\__color_set_aux:nnn 37945 \cs_new_protected:Npn \color_set:nn #1#2
\__color_set_colon:nnw 37946 {
\__color_set_loop:nnw 37947 \exp_args:NV \__color_set:nnn
\color_set_eq:nn 37948 \l_color_fixed_model_tl {#1} {#2}
37949 }
37950 \cs_new_protected:Npn \__color_set:nnn #1#2#3

37952 \tl_clear:N \l_color_fixed_model_tl
37953 \__color_set:nn {#2} {#3}
37954 \tl_set:Nn \l_color_fixed_model_tl {#1}
37955 }
37956 \cs_new_protected:Npn \__color_set:nn #1#2
37957 {
37958 \str_if_eq:nnF {#1} { . }
37959 {
37960 \__color_parse:nN {#2} \l__color_named_tl
37961 \tl_clear_new:c { l__color_named_ #1 _tl }
37962 \tl_set:ce { l__color_named_ #1 _tl }
37963 { \__color_model:N \l__color_named_tl }
37964 \prop_clear_new:c { l__color_named_ #1 _prop }
37965 \prop_put:cve { l__color_named_ #1 _prop } { l__color_named_ #1 _tl }
37966 { \__color_values:N \l__color_named_tl }
37967 \__color_set:nnw {#1} {#2} #2 ! \s__color_stop
37968 }
37969 }

```

When setting an expression-based color, there could be multiple model data available for one or more of the input colors. Where that is true for the *first* named color in an expression, we re-parse the expression when they are also parameter-based: only **cm**yk, **gray** and **rgb** make any sense here. There is a bit of a performance hit but this should be rare and taking place during set-up.

```

37970 \cs_new_protected:Npn \__color_set:nnw #1#2#3 ! #4 \s__color_stop

```

(End of definition for \g__color_alternative_values_prop.)

`\color_model_new:nnn` Set up a new model: in general this has to be handled by a family-dependent function.
`__color_model_new:nnn` To avoid some “interesting” questions with casing, we fold the case of the family name. The key–value list should always be present, so we convert it up-front to a `prop`, then deal with the detail on a per-family basis.

```

```

As each alternative space leads to a different requirement for conversion, and as there are only a small number of choices, we manually split the data and then set up. Notice that mixing tints is really just the same as mixing gray. The `white` color is special, as it

allows tints to be adjusted without an additional color space. To make sure the data is set for that at all group levels, we need to work on a per-level basis. Within the output, only the set-up needs the “real” name of the colorspace: we use a simple tracking number for general usage as this is a clear namespace without issues of escaping chars.

38349 }
```

If a CIELAB space is being set up, we need the illuminant, then create the appropriate set up. At present, this doesn't include BlackPoint or Range data, but that may be added later. As CIELAB colors cannot be converted to anything else, we fallback to producing black in the gray colorspace: the user should set up a second model for colors set up this way.

```

```

For short lists of DeviceN colors, we can use hand-tuned parsing. This lines up with other models, where we allow for up to four components. For larger spaces, rather than limit artificially, we use a somewhat slow approach based on open-ended commas-lists.

To construct the tint transformation, we have to use PostScript. The aim is to have the final tint for each device colorant as

$$1 - \prod_n (1 - X_n D_{X_n})$$

where X is a DeviceN colorant and D is the amount of device colorant that the DeviceN colorant maps to. At the start of the process, the PostScript stack will contain the X_n values, whilst we have the D values on a per-DeviceN colorant basis. The more convenient approach for us is therefore to take each DeviceN colorant in turn and find the value $1 - X_n D_{X_n}$, multiplying as we go, and finalise with the subtraction. That contrasts to `colorspace`: it splits the process up by process color, which works better when you have a fixed list of colorants. (`colorspace` only supports up to 4 DeviceN colors, and only `cmymk` as the alternative space.) To set this up, we first need to know the number of values in the target color space: this is easily handled as there are a very small range of possibilities. Once we have that information, it's relatively easy to build the required PostScript using some generic code.

```

38518 \cs_new_protected:Npn \_color_model_devicen_init:nnn #1#2#3
38519 {
38520     \exp_args:Ne \_color_model_devicen_init:nnnn

38523         {
38524             { cmyk } { 4 }
38525             { gray } { 1 }
38526             { rgb } { 3 }
38527         }
38528     }
38529     {#1} {#2} {#3}
38530 }

```

As we always need to split the alternative values into parts, we use a shared auxiliary and only use a minimal difference between code paths. Construction of the tint transformation is as far as possible done using loops, which means there are some inefficiencies for device colors in the DeviceN space: we roll the stack one-at-a-time even if there is a potential shortcut. However, that way there is nothing to special-case. Once this is sorted, we can write the tint transform object, which will remain as the last object until we sort out the final step: the colorant list.

(End of definition for _color_model_devicen:n and others.)

\c_color_icc_colorspace_signatures_prop

The signatures in the ICC file header indicating the underlying colorspace. We map it to three values: The number of components, the values corresponding to white, and the range.

```

38742 \prop_const_from_keyval:Nn \c_color_icc_colorspace_signatures_prop
38743   {
38744     % Gray
38745     47524159 = {1} {1} {0} {},
38746     % RGB

```

```

38747     52474220 = {3} {0~0~0} {1~1~1} {},
38748 % CMYK
38749     434D594B = {4} {0~0~0~1} {0~0~0~0} {},
38750 % Lab
38751     4C616220 = {3} {0~0~0} {100~0~0} {0~100~-128~127~-128~127}
38752 }

```

(End of definition for \c__color_icc_colorspace_signatures_prop.)

__color_model_iccbased:n For an ICC profile, we need a file name and a number of components. The file name is processed here so the backend can treat it as a string.

```

\__color_model_iccbased:nn
\__color_model_iccbased:nnn
  \__color_model_iccbased_aux:nnn
38753 \cs_new_protected:Npn \__color_model_iccbased:n #1

```

97.1 Graphics keys

Keys which control features of graphics. The standard value of `pagebox` set up here should match the default for the backends themselves: in the absence of any other setting the `crop` should be used. Note that the variable `\l__graphics_pagebox_str` can be empty internally, as backends which do not support `pagebox` are set up to clear it entirely. The store for `pagebox` is a `tl` as that makes extracting the data easier for some backends.

```
\l__graphics_decodearray_str
\l__graphics_draft_bool
\l__graphics_interpolate_bool
\l__graphics_page_int
\l__graphics_pagebox_tl
\l__graphics_pdf_str

```

Extracting the bounding box from an .eps or .bb file is done by reading each line and searching for the marker text %%BoundingBox:. The data is read as a string with a mapping over the lines: as there is a colon involved, a little bit of work is needed to get the matching correct. The same approach covers cases where the bounding box has to be calculated by extractbb, with just the initial phase different.

If the bounding box is `atend`, just ignore the current one and keep going. Otherwise, we need to allow for tabs and multiple spaces (as the line has been read as a string). The easiest way to deal with that is to scan the tokens: at this stage the line fragment should be just numbers and whitespace. T_EX will then tidy up for us, with just a leading space to worry about: that is taken out by the `\use:n` here.

```

39171 \seq_new:N \g__graphics_record_seq

```

(End of definition for `\g__graphics_record_seq`.)

`\graphics_include:nn`

`\graphics_include:nV`

`__graphics_include_search:n`

`__graphics_include:`

`__graphics_include_auxi:n`

`__graphics_include_auxi:e`

`__graphics_include_auxii:n`

`__graphics_include_auxiii:n`

`__graphics_include_auxiv:n`

Actually including an graphic is relatively straight-forward: most of the work is done by the backend. We only have to deal with making sure the box has no apparent depth. Where the first given name is not found, we search based on extension only if the `<type>` was not given. The one wrinkle is that we may have found a `.tex` file matching the file name stem: that's not what we want, so we have to filter out.

39464 }
39465 \code>
```

(End of definition for `\pdf_object_new:n` and others. These functions are documented on page 341.)

`__pdf_object_record:nN`
`__pdf_object_retrieve:n`
`ltx.pdf.object_id` Object mappings are tracked in Lua for LuaTeX as this makes retrieving them much easier; as a result, there is a split in approaches. In Lua we store values in a table indexed by name. The Lua function here is set up to deal with both named and indexed objects: fits the Lua idiom well.

```
39466 (*lua)
39467
39468 local scan_int = token.scan_int
39469 local scan_string = token.scan_string
39470 local cprint = tex.cprint
39471
39472 local __pdf_objects_named = {}
39473 local __pdf_objects_indexed = {}
39474
39475 luacmd('__pdf_object_record:nN', function()
39476   local name = scan_string()
39477   local n = scan_int()
39478   __pdf_objects_named[name] = n
39479 end, 'protected', 'global')
39480
39481 local function object_id(name, index)
```

```

39482   if index then
39483     return __pdf_objects_indexed[name][index] or 0
39484   else
39485     return __pdf_objects_named[name] or 0
39486   end
39487 end
39488
39489 luacmd('__pdf_object_retrieve:n', function()
39490   local name = scan_string()
39491   return cprint(12,toststring(object_id(name)))
39492 end,'global')
39493
39494 ltx.pdf = ltx.pdf or {}
39495 ltx.pdf.object_id = object_id
39496
39497 </lua>

```

Whereas in T_EX we use integer constants.

```

39498 (*code)
39499 \sys_if_engine luatex:F
39500 {
39501   \cs_new_protected:Npn \__pdf_object_record:nN #1#2
39502   {
39503     \int_const:cn
39504     { c__pdf_object_ #1 _int } {#2}
39505   }
39506   \cs_new:Npn \__pdf_object_retrieve:n #1
39507   {
39508     \int_if_exist:cTF { c__pdf_object_ #1 _int }
39509     {

39543 { \__pdf_object_retrieve:ne {#1} { \int_eval:n {#2} } }
39544 }
39545 \code

```

(End of definition for `\pdf_object_new_indexed:nn` and others. These functions are documented on page 342.)

```

\__pdf_object_record:nnN
\__pdf_object_record:neN
\__pdf_object_retrieve:nn
\__pdf_object_record:NnN
\__pdf_object_retrieve:Nn

```

Again we split for Lua: the same idea as above but with nested tables. As we've arranged above that the TeX code passes a braced number, we can use `tonumber(scan_string())` rather than `scan_int()` for the index.

```

39546 (*lua)
39547
39548 luacmd('__pdf_object_record:nnN', function()
39549 local name = scan_string()
39550 local index = tonumber(scan_string())
39551 local n = scan_int()
39552 __pdf_objects_indexed[name] = __pdf_objects_indexed[name] or {}
39553 __pdf_objects_indexed[name][index] = n
39554 end, 'protected', 'global')
39555
39556 luacmd('__pdf_object_retrieve:nn', function()
39557 local name = scan_string()
39558 local index = tonumber(scan_string())
39559 return cprint(12, tostring(object_id(name, index)))
39560 end, 'global')
39561
39562 \lua

```

The non-Lua approach is to divide the range into blocks, and store in integer arrays that can simulate dynamic assignment.

```

39563 (*code)
39564 \sys_if_engine luatex:F
39565 {
39566 \cs_new_protected:Npn \__pdf_object_record:nnN #1#2#3
39567 {
39568 \use:e

```

```

```

As we want blocks to start from one, and within the block for the top value to be “in” the block, we do a little bit of manipulation. By shifting down by one, we keep the values “in” the block, then we adjust the block/index number to get back on track.

```

Chapter 100

l3benchmark implementation

Our working unit is the scaled second, namely 2^{-16} seconds.

```
39721 < *code >
```

100.1 Benchmarking code

```
39722 < @@=benchmark >
```

```
\g_benchmark_duration_target_fp
```

The benchmark is constrained to take roughly (from half to twice) `\g_benchmark_duration_target_fp` seconds, unless one iteration of the code takes longer.

```
39723 \fp_new:N \g_benchmark_duration_target_fp
```

```
39724 \fp_gset:Nn \g_benchmark_duration_target_fp { 1 }
```

(End of definition for `\g_benchmark_duration_target_fp`. This variable is documented on page 346.)

100.1.1 Raw measurement

```
\g__benchmark_nesting_int  
  \__benchmark_raw:nN  
  \__benchmark_raw_aux:N  
  \__benchmark_raw_end:N
```

Store in the given integer variable the time it took to perform a given piece of code, in scaled seconds. We call `\sys_timer:` as close before and after the code as possible. We store the intermediate result in a new integer when `__benchmark_raw:nN` is nested.

```
39725 \int_new:N \g__benchmark_nesting_int
```

```
39726 \cs_new_protected:Npn \__benchmark_raw:nN #1
```

```
39727 {
```

```
39728   \int_gincr:N \g__benchmark_nesting_int
```

```
39729   \exp_args:Nc \__benchmark_raw_aux:N
```

```
39730     { g__benchmark_ \int_use:N \g__benchmark_nesting_int _int }
```

```
39731   \__benchmark_raw_aux:
```

```
39732   #1
```

```
39733   \__benchmark_raw_end:N
```

```
39734 }
```

```
39735 \cs_new_protected:Npn \__benchmark_raw_aux:N #1
```

```
39736 {
```

```
39737   \int_gzero_new:N #1
```

```
39738   \cs_gset_protected:Npn \__benchmark_raw_aux: { \int_gset:Nn #1 { \sys_timer: } }
```

```
39739 }
```

```
39740 \cs_new_protected:Npn \__benchmark_raw_end:N #1
```

```
39741 {
```

```

39742 \int_gset:Nn #1
39743 {
39744   \sys_timer: -
39745   \int_use:c { g__benchmark_ \int_use:N \g__benchmark_nesting_int _int }
39746 }
39747 \int_gdecr:N \g__benchmark_nesting_int
39748 }

```

(End of definition for `\g__benchmark_nesting_int` and others.)

```

\__benchmark_raw_replicate:nnN
\__benchmark_tmp:w

```

Here, we wish to measure the time it takes for the piece of code #2 to be run #1 times, and store the result in the integer #3.

If the number of copies required is large, defining `__benchmark_tmp:w` would exhaust T_EX's main memory. In that case, we replicate #1/5000 times the given code before passing it to the main call to `__benchmark_tmp:w`. Of course the division rounds to an integer, so that step introduces a relative error of order at most 5000/500000, less than many other sources of variability.

We subtract the time for another call to `__benchmark_tmp:w`, with the same arguments (to capture the time it takes to read the argument) but empty expansion.

```

39749 \cs_new_eq:NN \__benchmark_tmp:w ?
39750 \cs_new_protected:Npn \__benchmark_raw_replicate:nnN #1
39751 {

39773   \cs_set_eq:NN \__benchmark_tmp:w \prg_do_nothing:
39774 }

```

(End of definition for `__benchmark_raw_replicate:nnN` and `__benchmark_tmp:w`.)

100.1.2 Main benchmarking

```

\g_benchmark_time_fp
\g_benchmark_ops_fp

```

Functions such as `\benchmark:n` store the measured time in `\g_benchmark_time_fp` (in seconds) and the estimated number of operations in `\g_benchmark_ops_fp`.

```

39775 \fp_new:N \g_benchmark_time_fp
39776 \fp_new:N \g_benchmark_ops_fp

```

(End of definition for `\g_benchmark_time_fp` and `\g_benchmark_ops_fp`. These variables are documented on page 346.)

`\g__benchmark_duration_int` A conversion of `\g_benchmark_duration_target_fp` seconds into scaled seconds.

```
39777 \int_new:N \g__benchmark_duration_int
```

(End of definition for `\g__benchmark_duration_int`.)

`\g__benchmark_time_int` These variables hold the time for running a piece of code, as an integer in scaled seconds.

```
\g__benchmark_time_a_int 39778 \int_new:N \g__benchmark_time_int
\g__benchmark_time_b_int 39779 \int_new:N \g__benchmark_time_a_int
\g__benchmark_time_c_int 39780 \int_new:N \g__benchmark_time_b_int
\g__benchmark_time_d_int 39781 \int_new:N \g__benchmark_time_c_int
39782 \int_new:N \g__benchmark_time_d_int
```

(End of definition for `\g__benchmark_time_int` and others.)

`\g__benchmark_repeat_int` Holds the number of times that the piece of code was repeated when timing.

```
39783 \int_new:N \g__benchmark_repeat_int
```

(End of definition for `\g__benchmark_repeat_int`.)

`\g__benchmark_code_tl` Holds the piece of code to repeat.

```
39784 \tl_new:N \g__benchmark_code_tl
```

(End of definition for `\g__benchmark_code_tl`.)

`\benchmark_once:n` Convert the raw time from scaled seconds to seconds, and convert to a number of operations. It is important to measure the elementary operation before running the user code because both measurements use the same temporary variables.

`\benchmark_once_silent:n`

```
39785 \cs_new_protected:Npn \benchmark_once:n #1
39786 {
39787   \benchmark_once_silent:n {#1}
39788   \__benchmark_display:
39789 }
39790 \cs_new_protected:Npn \benchmark_once_silent:n #1
39791 {
39792   \__benchmark_measure_op:
39793   \__benchmark_raw:nN {#1} \g__benchmark_time_int
39794   \fp_gset:Nn \g_benchmark_time_fp { \g__benchmark_time_int / 65536 }
39795   \fp_gset:Nn \g_benchmark_ops_fp { \g_benchmark_time_fp / \g__benchmark_one_op_fp }
39796 }
```

(End of definition for `\benchmark_once:n` and `\benchmark_once_silent:n`. These functions are documented on page 346.)

`\benchmark:n` After setting up some variables the work is done by `__benchmark_aux:.`

```
39797 \cs_new_protected:Npn \benchmark:n #1
39798 {
39799   \benchmark_silent:n {#1}
39800   \__benchmark_display:
39801 }
39802 \cs_new_protected:Npn \benchmark_silent:n #1
39803 {
39804   \__benchmark_measure_op:
```

```

39805     \tl_gset:Nn \g__benchmark_code_tl {#1}
39806     \__benchmark_aux:
39807     \fp_gset:Nn \g_benchmark_ops_fp { \g_benchmark_time_fp / \g__benchmark_one_op_fp }
39808 }

```

(End of definition for `\benchmark:n`. This function is documented on page 346.)

`__benchmark_aux:` The main timing function. First time the user code once. If that took more than half the allotted time (`\g__benchmark_duration_int`) we're done. If that took much less, repeatedly quadruple the number of copies until it takes a reasonable amount of time. Once we reach a reasonable time (or we risk an overflow), compute a number of times that can fit in one quarter of the allotted time and measure that four times. To save time we reuse the result of the first pass if `\g__benchmark_repeat_int` is one. Once we have four results, find the smallest, divided by 65536 and by the number of repetitions, and display that.

```

39809 \cs_new_protected:Npn \__benchmark_aux:
39810 {
39811     \int_gset:Nn \g__benchmark_repeat_int { 1 }

39920 `</code>`

Chapter 101

l3deprecation implementation

```
39921 <code>
39922 <@@=deprecation>
```

101.1 Patching definitions to deprecate

```
&__kernel_patch_deprecation:nnNNpn {<date>} {<replacement>} <definition>
<function> <parameters> {<code>}
```

defines the *<function>* to produce an error and run its *<code>*.

We make `\debug_on:n {deprecation}` turn the *<function>* into an `\outer` error, and `\debug_off:n {deprecation}` restore whatever the behaviour was without `\debug_on:n {deprecation}`.

In the explanations below, *<definition>* *<function>* *<parameters>* {*<code>*} or assignments that only differ in the scope of the *<definition>* will be called “the standard definition”.

```
&__kernel_patch_deprecation:nnNNpn (The parameter text is grabbed using #5#.) The arguments of &__kernel_deprecation_
&__deprecation_patch_aux:nnNNnn code:nn are run upon \debug_on:n {deprecation} and \debug_off:n {deprecation},
&__deprecation_warn_once:nnNnn respectively. In both scenarios we the <function> may be \outer so we undefine it with
&__deprecation_patch_aux:Nn \tex_let:D before redefining it, with &__kernel_deprecation_error:Nnn or with some
&__deprecation_just_error:nnNN code added shortly.
```

```
39923 \cs_new_protected:Npn &__kernel_patch_deprecation:nnNNpn #1#2#3#4#5#
39924 { &__deprecation_patch_aux:nnNNnn {#1} {#2} #3 #4 {#5} }
39925 \cs_new_protected:Npn &__deprecation_patch_aux:nnNNnn #1#2#3#4#5#6
39926 {
39927   &__kernel_deprecation_code:nn
39928   {
39929     \tex_let:D #4 \scan_stop:
39930     &__kernel_deprecation_error:Nnn #4 {#2} {#1}
39931   }
39932   { \tex_let:D #4 \scan_stop: }
39933   \cs_if_eq:NNTF #3 \cs_gset_protected:Npn
39934   { &__deprecation_warn_once:nnNnn {#1} {#2} #4 {#5} {#6} }
39935   { &__deprecation_patch_aux:Nn #3 { #4 #5 {#6} } }
39936 }
```

In case we want a warning, the `\function` is defined to produce such a warning without grabbing any argument, then redefine itself to the standard definition that the `\function` should have, with arguments, and call that definition. The `e`-type expansion and `\exp_not:n` avoid needing to double the `#`, which we could not do anyways. We then deal with the code for `\debug_off:n {deprecation}`: presumably someone doing that does not need the warning so we simply do the standard definition.

```

39937 \cs_new_protected:Npn \__deprecation_warn_once:nnNnn #1#2#3#4#5
39938 {
39939   \cs_gset_protected:Npe #3
39940   {
39941     \__kernel_if_debug:TF
39942     {
39943       \exp_not:N \msg_warning:nneee
39944       { deprecation } { deprecated-command }
39945       {#1}
39946       { \token_to_str:N #3 }
39947       { \tl_to_str:n {#2} }
39948     }
39949     { }
39950     \exp_not:n { \cs_gset_protected:Npn #3 #4 {#5} }
39951     \exp_not:N #3
39952   }
39953   \__kernel_deprecation_code:nn { }
39954   { \cs_set_protected:Npn #3 #4 {#5} }
39955 }

```

In case we want neither warning nor error, the `\function` is given its standard definition. Here `#1` is `\cs_new:Npn` or `\cs_new_protected:Npn` and `#2` is `\function` `\parameters` `{\code}`, so `#1#2` performs the assignment. For `\debug_off:n {deprecation}` we want to use the same assignment but with a different scope, hence the `\cs_if_eq:NNTF` test.

```

39956 \cs_new_protected:Npn \__deprecation_patch_aux:Nn #1#2
39957 {
39958   #1 #2
39959   \cs_if_eq:NNTF #1 \cs_gset_protected:Npn
39960   { \__kernel_deprecation_code:nn { } { \cs_set_protected:Npn #2 } }
39961   { \__kernel_deprecation_code:nn { } { \cs_set:Npn #2 } }
39962 }

```

(End of definition for `__kernel_patch_deprecation:nnNNpn` and others.)

`__kernel_deprecation_error:Nnn` The `\outer` definition here ensures the command cannot appear in an argument.

```

39963 \cs_new_protected:Npn \__kernel_deprecation_error:Nnn #1#2#3
39964 {
39965   \tex_protected:D \tex_outer:D \tex_edef:D #1
39966   {
39967     \exp_not:N \msg_expandable_error:nnnnn
39968     { deprecation } { deprecated-command }
39969     { \tl_to_str:n {#3} } { \token_to_str:N #1 } { \tl_to_str:n {#2} }
39970     \exp_not:N \msg_error:nneee
39971     { deprecation } { deprecated-command }
39972     { \tl_to_str:n {#3} } { \token_to_str:N #1 } { \tl_to_str:n {#2} }
39973   }
39974 }

```

(End of definition for `__kernel_deprecation_error:Nnn`.)

```

39975 \msg_new:nnn { deprecation } { deprecated-command }
39976 {
39977   \tl_if_blank:nF {#3} { Use~ \tl_trim_spaces:n {#3} ~not~ }
39978   #2~deprecated-on~#1.
39979 }

```

101.2 Deprecated l3basics functions

39980 `<@@=cs>`

`\cs_argument_spec:N` For the present, do not deprecate fully as L^AT_EX 2_ε will need to catch up: one for Fall 2022.

```

39981 %\__kernel_patch_deprecation:nnNNpn { 2022-06-24 } { \cs_parameter_spec:N }

_debug_chk_var_scope_aux:NN
 _debug_chk_var_scope_aux:Nn
 _debug_chk_var_scope_aux:NNn

First check whether the name of the variable #2 starts with $\langle letter \rangle$. If it does then pass that letter, the $\langle scope \rangle$, and the variable name to _debug_chk_var_scope_aux:NNn. That function compares the two letters and triggers an error if they differ (the \scan_stop: case is not reachable here). If the second character was not _ then pass the same data to the same auxiliary, except for its first argument which is now a control sequence. That control sequence is actually a token list (but to avoid triggering the checking code we manipulate it using \cs_set_nopar:Npn) containing a single letter $\langle scope \rangle$ according to what the first assignment to the given variable was.

```

40365 }
40366 \cs_new_protected:cpn { __debug_log-functions_off: }
40367 { \cs_set_protected:Npn \__kernel_debug_log:e { \use_none:n } }
40368 \cs_new_protected:Npn \__kernel_debug_log:e { \use_none:n }

```

(End of definition for `__debug_log-functions_on:`, `__debug_log-functions_off:`, and `__kernel_debug_log:e`.)

`__debug_check-expressions_on:` When debugging is enabled these two functions set `__kernel_chk_expr:nNnN` to test or
`__debug_check-expressions_off:` not whether the given expression is valid. The idea is to evaluate the expression within
`__kernel_chk_expr:nNnN` a brace group (to catch trailing `\use_none:nn` or similar), then test that the result is
`__debug_chk_expr_aux:nNnN` what we expect. This is done by turning it to an integer and hitting that with `\tex_`
`__debug_chk_expr_aux:nNnN` `romannumeral:D` after replacing the first character by `-0`. If all goes well, that primitive
finds a non-positive integer and gives an empty output. If the original expression evaluation
stopped early it leaves a trailing `\tex_relax:D`, which stops the second evaluation
(used to convert to integer) before it encounters the final `\tex_relax:D`. Since `\tex_`
`romannumeral:D` does not absorb `\tex_relax:D` the output will be nonempty. Note
that `#3` is empty except for `mu` expressions for which it is `\tex_mutogluue:D` to avoid
an “incompatible glue units” error. Note also that if we had omitted the first `\tex_`
`relax:D` then for instance `1+2\relax+3` would incorrectly be accepted as a valid integer
expression.

```

40369 \cs_new_protected:cpn { __debug_check-expressions_on: }
40370 {

\__debug_get_base_form:N
\__debug_arg_return:N
\__debug_arg_if_braced:NTF

```

Some functions don't take the arguments their signature indicates. For instance, `\clist_concat:NNN` doesn't take (directly) any argument, so patching it with something that uses #1, #2, or #3 results in "Illegal parameter number in definition of `\clist_concat:NNN`".

Instead of changing *the* definition of the macros, we'll create a copy of such macros, say, `__debug_clist_concat:NNN` which will be defined as `<debug code with #1, #2 and #3>\clist_concat:NNN`. For that we need to identify the signature of every function and build the appropriate parameter list.

`__debug_generate_parameter_list:NNN` takes a function in #1 and returns two parameter lists: #2 contains the simple `#1#2#3` as would be used in the *<parameter text>* of the definition and #3 contains the same parameters but with braces where necessary.

With the current implementation the resulting #3 is, for example for `\some_function:NnNn`, `#1{#2}#3{#4}`. While this is correct, it might be unnecessary. Bracing everything will usually have the same outcome (unless the function was misused in the first place). What should be done?

```

\__debug_patch_weird:Nnn

```

Simple patching by adding material at the start and end of (a collection of) functions is straight-forward as we know the catcode set up. The approach is essentially that in `etoolbox`. Notice the need to worry about spaces: those are otherwise lost as normally in `expl3` code they would be `~`.

As discussed above, some functions don't take arguments, so we can't patch something that uses an argument in them. For these functions `__kernel_patch:nnn` is used. It starts by creating a copy of the function (say, `\clist_concat:NNN`) with a `__debug_` prefix in the name. This copy won't be changed. The code redefines the original function to take the exact same arguments as advertised in its signature (see `__debug_generate_parameter_list:NNN` above). The redefined function also contains the debug code in the proper position. If a function with the same name and the `__debug_` prefix was already defined, then the macro patches that definition by adding more debug code to it.

```

Some functions, however, won't work with the signature reading setup above because their signature contains weird arguments. These functions need to be patched using `__kernel_patch_weird:nnn`, which won't make a copy of the function, rather it will patch the debug code directly into it. This means that whatever argument the debug

code uses must be actually used by the patched function.

```

40547 \cs_set_protected:Npn \__kernel_patch_weird:nnn
40548 {
40549   \group_begin:
40550     \char_set_catcode_other:N \#
40551     \__kernel_patch_weird_aux:nnn
40552   }
40553 \cs_set_protected:Npn \__kernel_patch_weird_aux:nnn #1#2#3
40554 {
40555   \char_set_catcode_parameter:N \#
40556   \char_set_catcode_space:N \ %
40557   \tex_endlinechar:D -1 \scan_stop:
40558   \tl_map_inline:nn {#3}
40559     { \__debug_patch_weird:Nnn ##1 {#1} {#2} }
40560   \group_end:
40561 }
40562 \cs_set_protected:Npn \__debug_patch_weird:Nnn #1#2#3
40563 {
40564   \use:e
40565   {
40566     \tex_endlinechar:D -1 \scan_stop:
40567     \exp_not:N \tex_scantokens:D
40568     {
40569       \tex_global:D \cs_prefix_spec:N #1
40570       \tex_def:D \exp_not:N #1

40576       }
40577     }
40578   }
40579 }

```

(End of definition for __kernel_patch:nnn and others.)

Patching the second argument to ensure it exists. This happens before we alter #1 so the ordering is correct. For many variable types such as `int` a low-level error occurs when #2 is unknown, so adding a check is not needed.

```

40580 \__kernel_patch:nnn
40581 { \__kernel_chk_var_exist:N #2 }
40582 { }
40583 {
40584   \bool_set_eq:NN
40585   \bool_gset_eq:NN

40987   \group_end:
40988 }

```

The functions here can get a bit repetitive, so we define a helper which can reuse the same patch code repeatedly. The main part of the patch is the same, so we just have to deal with the part which varies depending on the type of expression.
